Life cycle assessment performed with EIME version EIME© v5.6.0.1, database version 2016-11.

The use phase is the life cycle phase which has the greatest impact on the majority of environmental indicators (based on compulsory indicators).

According to this environmental analysis, proportionality rules may be used to evaluate the impacts of other products of this range.

Depending on the impact analysis, For Contribution to mineral resources depletion, impact may be proportional extrapolated 55% by manufacturing and 45% by energy consumption. For Contribution to ozone layer depletion, impact may be proportional extrapolated 18% by manufacturing and 82% by energy consumption, the other environmental indicators of other products in this family may be proportional extrapolated by energy consumption.

Please note that the values given above are only valid within the context specified and cannot be used directly to draw up the environmental assessment of an installation.
