# Lexium 32i ETH and BMi Integrated Servo Drive System User Guide 

11/2017

The information provided in this documentation contains general descriptions and/or technical characteristics of the performance of the products contained herein. This documentation is not intended as a substitute for and is not to be used for determining suitability or reliability of these products for specific user applications. It is the duty of any such user or integrator to perform the appropriate and complete risk analysis, evaluation and testing of the products with respect to the relevant specific application or use thereof. Neither Schneider Electric nor any of its affiliates or subsidiaries shall be responsible or liable for misuse of the information contained herein. If you have any suggestions for improvements or amendments or have found errors in this publication, please notify us.
You agree not to reproduce, other than for your own personal, noncommercial use, all or part of this document on any medium whatsoever without permission of Schneider Electric, given in writing. You also agree not to establish any hypertext links to this document or its content. Schneider Electric does not grant any right or license for the personal and noncommercial use of the document or its content, except for a non-exclusive license to consult it on an "as is" basis, at your own risk. All other rights are reserved.
All pertinent state, regional, and local safety regulations must be observed when installing and using this product. For reasons of safety and to help ensure compliance with documented system data, only the manufacturer should perform repairs to components.

When devices are used for applications with technical safety requirements, the relevant instructions must be followed.

Failure to use Schneider Electric software or approved software with our hardware products may result in injury, harm, or improper operating results.

Failure to observe this information can result in injury or equipment damage.

## Table of Contents

Safety Information. ..... 9
About the Book ..... 13
Chapter 1 Introduction ..... 17
Device Overview ..... 18
Type Code ..... 19
Chapter 2 Technical Data ..... 21
Environmental Conditions ..... 22
Dimensions ..... 24
General Characteristics ..... 26
Signals ..... 28
Shaft-Specific Data ..... 30
Motor-Specific Data ..... 32
Holding Brake (Option) ..... 37
Encoder ..... 38
Braking Resistor ..... 39
Electromagnetic Emission ..... 41
Tightening Torque of Screws and Cable Glands ..... 42
Non-Volatile Memory and Memory Card ..... 43
Certifications ..... 44
Conditions for UL 508C ..... 45
Chapter 3 Engineering ..... 47
3.1 Electromagnetic Compatibility (EMC) ..... 48
General ..... 49
Deactivating the Y Capacitors ..... 51
3.2 Cables and Signals ..... 52
Cables - General ..... 53
Overview of the Required Cables ..... 55
Wiring Concept ..... 56
Logic Type ..... 57
Configurable Inputs and Outputs ..... 58
Mounting Types of The Modules ..... 59
3.3 Mains Supply ..... 60
Residual Current Device ..... 61
Mains Reactor ..... 62
3.4 Rating the Braking Resistor. ..... 63
Standard Braking Resistor ..... 64
External Braking Resistor ..... 65
Rating Information ..... 66
3.5 Functional Safety ..... 69
Basics ..... 70
Definitions ..... 73
Function. ..... 74
Requirements for Using the Safety Function ..... 75
Protected Cable Installation for Safety-Related Signals ..... 77
Application Examples STO ..... 79
3.6 PROFINET Fieldbus ..... 81
Conformance Classes ..... 82
Network Topology ..... 83
Data Structure ..... 84
Cyclic Communication - Overview ..... 85
Cyclic Communication - Structure of the Output Data ..... 86
Cyclic Communication - Structure of the Input Data ..... 87
Cyclic Communication - Parameter Channel ..... 89
Cyclic Communication - Handshake via the "Mode Toggle" Bit. ..... 91
Acyclic Communication - Overview ..... 92
Acyclic Communication - Example: Reading a Parameter (with Configuration Tool STEP 7) ..... 93
Chapter 4 Installation ..... 95
4.1 Mechanical Installation ..... 96
Before Mounting ..... 97
Mounting the Motor ..... 98
4.2 Electrical Installation ..... 101
General ..... 102
Ground Connection ..... 103
Mounting LXM32i ..... 104
Standard Braking Resistor ..... 105
External Braking Resistor (Accessories) ..... 106
Mains Supply ..... 108
Commissioning Interface ..... 111
Mounting the I/O Connection Module. ..... 112
4.3 I/O Module with Industrial Connectors ..... 113
Overview I/O Modules with Industrial Connectors ..... 114
Logic Type ..... 117
Connection of the Digital Inputs and Digital Outputs ..... 118
Connection of Safety Function STO. ..... 119
Fieldbus Connection ..... 120
4.4 I/O Module with Spring Terminals ..... 121
Opening the I/O Module ..... 122
Overview I/O Module with Spring Terminals ..... 123
Setting the Logic Type ..... 124
Connection of the Digital Inputs/Outputs ..... 125
Connection of Safety Function STO ..... 127
Fieldbus Connection ..... 130
Connecting the Signals ..... 132
Closing the I/O Module. ..... 133
4.5 Verifying Installation ..... 134
Verifying Installation ..... 134
Chapter 5 Commissioning. ..... 135
5.1 Overview ..... 136
General ..... 137
Preparation. ..... 140
5.2 Fieldbus Integration ..... 142
Selecting the Fieldbus ..... 143
Setting the IP Address ..... 144
Setting the Device Name ..... 147
Settings with the Configuration Tool STEP7 - V13 (TIA Portal) ..... 148
Settings with the Configuration Tool STEP7 - V5 ..... 150
5.3 Commissioning Procedure ..... 152
Setting Limit Values ..... 153
Digital Inputs and Outputs ..... 155
Verifying the Signals of the Limit Switches ..... 156
Verifying the Safety Function STO ..... 157
Holding Brake (Option) ..... 158
Verifying the Direction of Movement ..... 160
Setting Parameters for Encoder ..... 162
Setting the Braking Resistor Parameters ..... 165
Autotuning ..... 167
Enhanced Settings for Autotuning ..... 170
5.4 Controller Optimization with Step Response ..... 172
Controller Structure ..... 173
Optimization. ..... 175
Optimizing the Velocity Controller ..... 176
Verifying and Optimizing the P Gain ..... 180
Optimizing the Position Controller ..... 181
5.5 Parameter Management ..... 183
Memory Card ..... 184
Duplicating Existing Parameter Values ..... 186
Resetting the User Parameters ..... 187
Restoring Factory Settings ..... 188
Chapter 6 Operation ..... 189
6.1 Access Channels ..... 190
Access Channels ..... 190
6.2 Movement Range ..... 191
Size of the Movement Range ..... 192
Movement Beyond the Movement Range ..... 193
Setting a Modulo Range ..... 195
6.3 Modulo Range ..... 196
Setting a Modulo Range ..... 197
Parameterization ..... 198
Examples with Relative Movements ..... 200
Examples with Absolute Movements and "Shortest Distance" ..... 201
Examples with Absolute Movements and "Positive Direction" ..... 202
Examples with Absolute Movements and "Negative Direction" ..... 203
6.4 Scaling ..... 204
General ..... 205
Configuration of position scaling ..... 206
Configuration of Velocity Scaling. . ..... 207
Configuration of Ramp Scaling ..... 208
6.5 Digital Inputs and Outputs ..... 209
Parameterization of the Signal Input Functions ..... 210
Parameterization of the Signal Output Functions ..... 215
Parameterization of Software Debouncing ..... 218
6.6 Switching Between Control Loop Parameter Sets. ..... 219
Overview of the Controller Structure ..... 220
Overview of Position Controller ..... 221
Overview of Velocity Controller ..... 222
Overview of Current Controller ..... 223
Parameterizable Control Loop Parameters ..... 224
Selecting a Control Loop Parameter Set ..... 225
Automatically Switching Between Control Loop Parameter Sets ..... 226
Copying a Control Loop Parameter Set. ..... 230
Deactivating the Integral Term ..... 231
Control Loop Parameter Set 1 ..... 232
Control Loop Parameter Set 2 ..... 234
Chapter 7 Operating States and Operating Modes ..... 237
7.1 Operating States ..... 238
State Diagram and State Transitions ..... 239
Indication of the Operating State via Signal Outputs ..... 242
Indication of the Operating State via Fieldbus ..... 243
Changing the Operating State via Signal Inputs ..... 244
Changing the Operating State via Fieldbus ..... 246
7.2 Indicating, Starting and Changing an Operating Mode ..... 247
Indicating an Operating Mode ..... 248
Starting and Changing an Operating Mode ..... 249
7.3 Operating Mode Jog. ..... 250
Overview ..... 251
Parameterization ..... 254
Additional Settings ..... 257
7.4 Operating Mode Profile Torque ..... 258
Overview ..... 259
Parameterization ..... 260
Additional Settings ..... 262
7.5 Operating Mode Profile Velocity. ..... 263
Overview ..... 264
Parameterization ..... 265
Additional Settings ..... 266
7.6 Operating Mode Profile Position ..... 267
Overview ..... 268
Parameterization ..... 269
Additional Settings ..... 271
7.7 Operating Mode Homing ..... 272
Overview ..... 273
Parameterization ..... 275
Reference Movement to a Limit Switch ..... 280
Reference Movement to the Reference Switch in Positive Direction. ..... 281
Reference Movement to the Reference Switch in Negative Direction ..... 282
Reference Movement to the Index Pulse. ..... 283
Position Setting ..... 284
Additional Settings ..... 285
Chapter 8 Functions for Operation ..... 287
8.1 Functions for Target Value Processing ..... 288
Motion Profile for the Velocity ..... 289
Jerk Limitation ..... 291
Stop Movement with Halt ..... 292
Stop Movement with Quick Stop ..... 294
Limitation of the Velocity via Signal Inputs ..... 296
Limitation of the Current via Signal Inputs ..... 297
Zero Clamp ..... 298
Setting a Signal Output via Parameter ..... 299
Starting a Movement via a Signal Input ..... 300
Position Capture via Signal Input ..... 301
Relative Movement After Capture (RMAC) ..... 304
Backlash Compensation ..... 307
8.2 Functions for Monitoring Movements ..... 309
Limit Switches ..... 310
Reference Switch ..... 311
Software Limit Switches ..... 312
Load-Dependent Position Deviation (Following Error) ..... 314
Load-Dependent Velocity Deviation ..... 317
Motor Standstill and Direction of Movement ..... 319
Torque Window ..... 320
Velocity Window ..... 321
Standstill Window ..... 322
Position Register ..... 324
Position Deviation Window ..... 329
Velocity Deviation Window ..... 331
Velocity Threshold Value. ..... 333
Current Threshold Value ..... 335
Adjustable Bits of the Status Parameters ..... 337
8.3 Functions for Monitoring Internal Device Signals ..... 340
Temperature Monitoring ..... 341
Monitoring Load and Overload ( $I^{2} \mathrm{~T}$ Monitoring) ..... 342
Commutation Monitoring ..... 344
Monitoring of Mains Phases ..... 345
Ground Fault Monitoring ..... 346
Chapter 9 Diagnostics and Troubleshooting ..... 347
9.1 Diagnostics via LEDs ..... 348
Overview Diagnostics LEDs ..... 349
Fieldbus Status LEDs ..... 350
Operating State LEDs ..... 352
Memory Card LEDs ..... 353
DC Bus LED ..... 354
9.2 Diagnostics via Signal Outputs ..... 355
Indicating the Operating State ..... 356
Indicating Error Messages. ..... 357
9.3 Diagnostics via the Fieldbus ..... 358
Fieldbus Communication Error Diagnostics ..... 359
Most Recent Detected Error - Status Bits ..... 360
Error Messages ..... 362
Most Recent Detected Error - Error Code ..... 364
Error Memory ..... 365
9.4 Error Messages ..... 367
Description of Error Messages ..... 368
Table of Error Messages ..... 369
Chapter 10 Parameters ..... 393
Representation of the Parameters ..... 394
List of Parameters ..... 396
Chapter 11 Accessories and Spare Parts ..... 475
Commissioning Tools ..... 476
Memory Cards ..... 477
Mains Supply for Slot 1 or Slot 2 ..... 478
Braking Resistors for Slot 1 or Slot 2. ..... 479
External Braking Resistors ..... 480
I/O Module with Industrial Connector for Positive Logic ..... 481
I/O Module with Industrial Connector for Negative Logic ..... 482
I/O Module with Spring Terminals ..... 483
Cables for Safety Function STO ..... 484
Industrial Plug Connectors ..... 485
Chapter 12 Service, Maintenance, and Disposal ..... 487
Service Addresses ..... 488
Maintenance. ..... 489
Replacing the Product ..... 491
Shipping, Storage, Disposal ..... 492
Glossary ..... 493
Index ..... 497

# Safety Information 

## Important Information

## NOTICE

Read these instructions carefully, and look at the equipment to become familiar with the device before trying to install, operate, service, or maintain it. The following special messages may appear throughout this documentation or on the equipment to warn of potential hazards or to call attention to information that clarifies or simplifies a procedure.

The addition of this symbol to a "Danger" or "Warning" safety label indicates that an electrical hazard exists which will result in personal injury if the instructions are not followed.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

## DANGER

DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.

WARNING
WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.

## A CAUTION

CAUTION indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

## NOTICE

NOTICE is used to address practices not related to physical injury.

## PLEASE NOTE

Electrical equipment should be installed, operated, serviced, and maintained only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this material.

A qualified person is one who has skills and knowledge related to the construction and operation of electrical equipment and its installation, and has received safety training to recognize and avoid the hazards involved.

## QUALIFICATION OF PERSONNEL

Only appropriately trained persons who are familiar with and understand the contents of this manual and all other pertinent product documentation are authorized to work on and with this product. These persons must have sufficient technical training, knowledge and experience and be able to foresee and detect potential hazards that may be caused by using the product, by modifying the settings and by the mechanical, electrical and electronic equipment of the entire system in which the product is used.

The qualified person must be able to detect possible hazards that may arise from parameterization, modifying parameter values and generally from mechanical, electrical, or electronic equipment.
The qualified person must be familiar with the standards, provisions, and regulations for the prevention of industrial accidents, which they must observe when designing and implementing the system.

The products described or affected by this document are, along with software, accessories and options, servo motors with an integrated drive. The products are intended for industrial use according to the instructions, directions, examples and safety information contained in the present user guide and other supporting documentation.
The product may only be used in compliance with all applicable safety regulations and directives, the specified requirements and the technical data.
Prior to using the products, you must perform a risk assessment in view of the planned application. Based on the results, the appropriate safety-related measures must be implemented.
Since the products are used as components in an overall machine or process, you must ensure the safety of persons by means of the design of this overall machine or process.
Operate the products only with the specified cables and accessories. Use only genuine accessories and spare parts.
Any use other than the use explicitly permitted as described herein is prohibited and may result in unanticipated hazards.

## BEFORE YOU BEGIN

Do not use this product on machinery lacking effective point-of-operation guarding. Lack of effective point-of-operation guarding on a machine can result in serious injury to the operator of that machine.

## A WARNING

## UNGUARDED EQUIPMENT

- Do not use this software and related automation equipment on equipment which does not have point-of-operation protection.
- Do not reach into machinery during operation.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

This automation equipment and related software is used to control a variety of industrial processes. The type or model of automation equipment suitable for each application will vary depending on factors such as the control function required, degree of protection required, production methods, unusual conditions, government regulations, etc. In some applications, more than one processor may be required, as when backup redundancy is needed.
Only you, the user, machine builder or system integrator can be aware of all the conditions and factors present during setup, operation, and maintenance of the machine and, therefore, can determine the automation equipment and the related safeties and interlocks which can be properly used. When selecting automation and control equipment and related software for a particular application, you should refer to the applicable local and national standards and regulations. The National Safety Council's Accident Prevention Manual (nationally recognized in the United States of America) also provides much useful information.
In some applications, such as packaging machinery, additional operator protection such as point-ofoperation guarding must be provided. This is necessary if the operator's hands and other parts of the body are free to enter the pinch points or other hazardous areas and serious injury can occur. Software products alone cannot protect an operator from injury. For this reason the software cannot be substituted for or take the place of point-of-operation protection.
Ensure that appropriate safeties and mechanical/electrical interlocks related to point-of-operation protection have been installed and are operational before placing the equipment into service. All interlocks and safeties related to point-of-operation protection must be coordinated with the related automation equipment and software programming.
NOTE: Coordination of safeties and mechanical/electrical interlocks for point-of-operation protection is outside the scope of the Function Block Library, System User Guide, or other implementation referenced in this documentation.

## START-UP AND TEST

Before using electrical control and automation equipment for regular operation after installation, the system should be given a start-up test by qualified personnel to verify correct operation of the equipment. It is important that arrangements for such a check be made and that enough time is allowed to perform complete and satisfactory testing

## A WARNING

## EQUIPMENT OPERATION HAZARD

- Verify that all installation and set up procedures have been completed.
- Before operational tests are performed, remove all blocks or other temporary holding means used for shipment from all component devices.
- Remove tools, meters, and debris from equipment.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Follow all start-up tests recommended in the equipment documentation. Store all equipment documentation for future references.

Software testing must be done in both simulated and real environments.
Verify that the completed system is free from all short circuits and temporary grounds that are not installed according to local regulations (according to the National Electrical Code in the U.S.A, for instance). If highpotential voltage testing is necessary, follow recommendations in equipment documentation to prevent accidental equipment damage.
Before energizing equipment:

- Remove tools, meters, and debris from equipment.
- Close the equipment enclosure door.
- Remove all temporary grounds from incoming power lines.
- Perform all start-up tests recommended by the manufacturer.

## OPERATION AND ADJUSTMENTS

The following precautions are from the NEMA Standards Publication ICS 7.1-1995 (English version prevails):

- Regardless of the care exercised in the design and manufacture of equipment or in the selection and ratings of components, there are hazards that can be encountered if such equipment is improperly operated.
- It is sometimes possible to misadjust the equipment and thus produce unsatisfactory or unsafe operation. Always use the manufacturer's instructions as a guide for functional adjustments. Personnel who have access to these adjustments should be familiar with the equipment manufacturer's instructions and the machinery used with the electrical equipment.
- Only those operational adjustments actually required by the operator should be accessible to the operator. Access to other controls should be restricted to prevent unauthorized changes in operating characteristics.

## About the Book

At a Glance

Document Scope
This manual describes technical characteristics, installation, commissioning, operation and maintenance of the integrated servo drive system Lexium 32i ETH + BMi.

Validity Note
This manual is valid for the standard products listed in the type code, see chapter Type Code (see page 19).
For product compliance and environmental information (RoHS, REACH, PEP, EOLI, etc.), go to www.schneider-electric.com/green-premium.
The technical characteristics of the devices described in this document also appear online. To access this information online:

| Step | Action |
| :---: | :--- |
| 1 | Go to the Schneider Electric home page www. schneider-electric.com. |
| 2 | In the Search box type the reference of a product or the name of a product range. <br> - Do not include blank spaces in the reference or product range. <br> To get information on grouping similar modules, use asterisks ( $).$ |
| 3 | If you entered a reference, go to the Product Datasheets search results and click on the reference that <br> interests you. <br> If you entered the name of a product range, go to the Product Ranges search results and click on the <br> product range that interests you. |
| 4 | If more than one reference appears in the Products search results, click on the reference that interests <br> you. |
| 5 | Depending on the size of your screen, you may need to scroll down to see the data sheet. |
| 6 | To save or print a data sheet as a .pdf file, click Download XXX product datasheet. |

The characteristics that are presented in this manual should be the same as those characteristics that appear online. In line with our policy of constant improvement, we may revise content over time to improve clarity and accuracy. If you see a difference between the manual and online information, use the online information as your reference.

## Product Related Information

The use and application of the information contained herein require expertise in the design and programming of automated control systems.
Only you, the user, machine builder or integrator, can be aware of all the conditions and factors present during installation and setup, operation, repair and maintenance of the machine or process.
You must also consider any applicable standards and/or regulations with respect to grounding of all equipment. Verify compliance with any safety information, different electrical requirements, and normative standards that apply to your machine or process in the use of this equipment.
Many components of the equipment, including the printed circuit board, operate with mains voltage, or present transformed high currents, and/or high voltages.
The motor itself generates voltage when the motor shaft is rotated.

## 4 DANGER

## ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Disconnect all power from all equipment including connected devices prior to removing any covers or doors, or installing or removing any accessories, hardware, cables, or wires.
- Place a "Do Not Turn On" or equivalent hazard label on all power switches and lock them in the nonenergized position.
- Wait 15 minutes to allow the residual energy of the DC bus capacitors to discharge.
- Do not assume that the DC bus is voltage-free when the DC bus LED is off.
- Block the motor shaft to prevent rotation prior to performing any type of work on the drive system.
- Replace and secure all covers, accessories, hardware, cables, and wires and confirm that a proper ground connection exists before applying power to the unit.
- Use only the specified voltage when operating this equipment and any associated products.

Failure to follow these instructions will result in death or serious injury.
This equipment has been designed to operate outside of any hazardous location. Only install this equipment in zones known to be free of a hazardous atmosphere.

## A. DANGER

## POTENTIAL FOR EXPLOSION

Install and use this equipment in non-hazardous locations only.
Failure to follow these instructions will result in death or serious injury.
If the power stage is disabled unintentionally, for example as a result of power outage, errors or functions, the motor is no longer decelerated in a controlled way. Overload, errors or incorrect use may cause the holding brake to no longer operate properly and may result in premature wear.

|  |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| - Verify that movements without braking effect cannot cause injuries or equipment damage. |
| - Verify the function of the holding brake at regular intervals. |
| - Do not use the holding brake as a service brake. |
| - Do not use the holding brake for safety-related purposes. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

Drive systems may perform unanticipated movements because of incorrect wiring, incorrect settings, incorrect data or other errors.

| ( 1 WARNING |
| :--- |
| UNINTENDED MOVEMENT OR MACHINE OPERATION |
| - Carefully install the wiring in accordance with the EMC requirements. |
| - Do not operate the product with undetermined settings and data. |
| - Perform comprehensive commissioning tests that include verification of configuration settings and |
| data that determine position and movement. |

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## A WARNING

## LOSS OF CONTROL

- The designer of any control scheme must consider the potential failure modes of control paths and, for certain critical control functions, provide a means to achieve a safe state during and after a path failure. Examples of critical control functions are emergency stop and overtravel stop, power outage and restart.
- Separate or redundant control paths must be provided for critical control functions.
- System control paths may include communication links. Consideration must be given to the implications of unanticipated transmission delays or failures of the link.
- Observe all accident prevention regulations and local safety guidelines. ${ }^{1}$
- Each implementation of this equipment must be individually and thoroughly tested for proper operation before being placed into service.
Failure to follow these instructions can result in death, serious injury, or equipment damage.
${ }^{1}$ For additional information, refer to NEMA ICS 1.1 (latest edition), "Safety Guidelines for the Application, Installation, and Maintenance of Solid State Control" and to NEMA ICS 7.1 (latest edition), "Safety Standards for Construction and Guide for Selection, Installation and Operation of Adjustable-Speed Drive Systems" or their equivalent governing your particular location.
Machines, controllers, and related equipment are usually integrated into networks. Unauthorized persons and malware may gain access to the machine as well as to other devices on the network/fieldbus of the machine and connected networks via insufficiently secure access to software and networks.
Schneider Electric adheres to industry best practices in the development and implementation of control systems. This includes a "Defense-in-Depth" approach to secure an Industrial Control System. This approach places the controllers behind one or more firewalls to restrict access to authorized personnel and protocols only.

## A WARNING

## UNAUTHENTICATED ACCESS AND SUBSEQUENT UNAUTHORIZED MACHINE OPERATION

- Evaluate whether your environment or your machines are connected to your critical infrastructure and, if so, take appropriate steps in terms of prevention, based on Defense-in-Depth, before connecting the automation system to any network.
- Limit the number of devices connected to a network to the minimum necessary.
- Isolate your industrial network from other networks inside your company.
- Protect any network against unintended access by using firewalls, VPN, or other, proven security measures.
- Monitor activities within your systems.
- Prevent subject devices from direct access or direct link by unauthorized parties or unauthenticated actions.
- Prepare a recovery plan including backup of your system and process information.

Failure to follow these instructions can result in death, serious injury, or equipment damage.
For more information on organizational measures and rules covering access to infrastructures, refer to ISO/IEC 27000 series, Common Criteria for Information Technology Security Evaluation, ISO/IEC 15408, IEC 62351, ISA/IEC 62443, NIST Cybersecurity Framework, Information Security Forum - Standard of Good Practice for Information Security.

## Terminology Derived from Standards

The technical terms, terminology, symbols and the corresponding descriptions in this manual, or that appear in or on the products themselves, are generally derived from the terms or definitions of international standards.

In the area of functional safety systems, drives and general automation, this may include, but is not limited to, terms such as safety, safety function, safe state, fault, fault reset, malfunction, failure, error, error message, dangerous, etc.
Among others, these standards include:

| Standard | Description |
| :--- | :--- |
| EN 61131-2:2007 | Programmable controllers, part 2: Equipment requirements and tests. |
| ISO 13849-1:2008 | Safety of machinery: Safety related parts of control systems. <br> General principles for design. |
| EN 61496-1:2013 | Safety of machinery: Electro-sensitive protective equipment. <br> Part 1: General requirements and tests. |
| ISO 12100:2010 | Safety of machinery - General principles for design - Risk assessment and risk reduction |
| EN 60204-1:2006 | Safety of machinery - Electrical equipment of machines - Part 1: General requirements |
| EN 1088:2008 <br> ISO 14119:2013 | Safety of machinery - Interlocking devices associated with guards - Principles for design <br> and selection |
| ISO 13850:2006 | Safety of machinery - Emergency stop - Principles for design |
| EN/IEC 62061:2005 | Safety of machinery - Functional safety of safety-related electrical, electronic, and <br> electronic programmable control systems |
| IEC 61508-1:2010 | Functional safety of electrical/electronic/programmable electronic safety-related <br> systems: General requirements. |
| IEC 61508-2:2010 | Functional safety of electrical/electronic/programmable electronic safety-related <br> systems: Requirements for electrical/electronic/programmable electronic safety-related <br> systems. |
| IEC 61508-3:2010 | Functional safety of electrical/electronic/programmable electronic safety-related <br> systems: Software requirements. |
| IEC 61784-3:2008 | Digital data communication for measurement and control: Functional safety field buses. |
| 2006/42/EC | Machinery Directive |
| 2014/30/EU | Electromagnetic Compatibility Directive |
| 2014/35/EU | Low Voltage Directive |

In addition, terms used in the present document may tangentially be used as they are derived from other standards such as:

| Standard | Description |
| :--- | :--- |
| IEC 60034 series | Rotating electrical machines |
| IEC 61800 series | Adjustable speed electrical power drive systems |
| IEC 61158 series | Digital data communications for measurement and control - Fieldbus for use in industrial <br> control systems |

Finally, the term zone of operation may be used in conjunction with the description of specific hazards, and is defined as it is for a hazard zone or danger zone in the Machinery Directive (2006/42/EC) and ISO 12100:2010.
NOTE: The aforementioned standards may or may not apply to the specific products cited in the present documentation. For more information concerning the individual standards applicable to the products described herein, see the characteristics tables for those product references.

## Chapter 1

## Introduction

What Is in This Chapter?
This chapter contains the following topics:

| Topic | Page |
| :--- | :---: |
| Device Overview | 18 |
| Type Code | 19 |

## Device Overview

The modular components of the product family Lexium 32 i can be combined to meet the requirements of a great variety of applications. Minimum wiring as well as a comprehensive portfolio of options and accessories allow you to implement compact, high-performance drive solutions for a wide range of power requirements.

Overview of some of the features:

- Communication interface for PROFINET; the reference values for numerous operating modes are supplied via this interface.
- The product is commissioned via a PC with commissioning software or the fieldbus.
- Memory cards allow for copying of parameters and fast device replacement.
- The safety function "Safe Torque Off" (STO) as per IEC 61800-5-2 is implemented on board.

PROFINET is an Ethernet-based fieldbus which allows you to network products from different manufacturers without the need for special interface adaptation.

Servo Drive System
The product can comprise the following components:

1 BMi servomotor with integrated power stage
2 Standard braking resistor
3 LXM32i control unit for PROFINET fieldbus
4 Cover of commissioning interface
5 Connection module for mains supply
6 Connection module with spring terminals or industrial connector for fieldbus, inputs/outputs and safety function STO
For an overview of the available accessories see chapter Accessories and Spare Parts (see page 475).

## Type Code

Type Code LXM32I

| Item | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ | $\mathbf{9}$ | 10 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Type code (example) | L | X | M | 3 | 2 | I | E | T | H | $\bullet$ |

| Item | Meaning |
| :--- | :--- |
| $1 \ldots 3$ | Product family <br> LXM = Lexium |
| $4 \ldots 6$ | Product type <br> $32 I ~=~ C o n t r o l ~ u n i t ~ f o r ~ L e x i u m ~ 32 i ~$ |
| $7 \ldots 9$ | Fieldbus interface <br> ETH = Multi-Ethernet (PROFINET) |
| 10 | Customized Version <br> S = Customized version |

If you have questions concerning the type code, contact your Schneider Electric representative

Designation Customized Version
In the case of a customized version, position 10 of the type code is an " $S$ ". The subsequent number defines the customized version. Example: LXM32|•••S1234
Contact your local Schneider Electric service representative if you have questions concerning customized versions.

Type Code BMI

| Item | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ | $\mathbf{9}$ | $\mathbf{1 0}$ | $\mathbf{1 1}$ |

| 11 | Holding brake <br> A $=$ Without holding brake <br> $\mathrm{F}=$ With holding brake |

1) In the case of mounting position IM V3 (drive shaft vertical, shaft end upward), the motor only has degree of protection IP 50.

If you have questions concerning the type code, contact your Schneider Electric representative.

## Designation Customized Version

In the case of a customized version, position 9 of the type code is an " S ". The subsequent number defines the customized version. Example: BMI.....S123

Contact your local Schneider Electric service representative if you have questions concerning customized versions.

## Chapter 2

## Technical Data

What Is in This Chapter?
This chapter contains the following topics:

| Topic | Page |
| :--- | :---: |
| Environmental Conditions | 22 |
| Dimensions | 24 |
| General Characteristics | 26 |
| Signals | 28 |
| Shaft-Specific Data | 30 |
| Motor-Specific Data | 32 |
| Holding Brake (Option) | 37 |
| Encoder | 38 |
| Braking Resistor | 39 |
| Electromagnetic Emission | 41 |
| Tightening Torque of Screws and Cable Glands | 42 |
| Non-Volatile Memory and Memory Card | 43 |
| Certifications | 44 |
| Conditions for UL 508C | 45 |

## Environmental Conditions

## Conditions for Transportation and Storage

The environment during transportation and storage must be dry and free from dust.

| Temperature | ${ }^{\circ} \mathrm{C}$ | $-25 \ldots 70$ |
| :--- | :--- | :--- |
| $\left({ }^{\circ} \mathrm{F}\right)$ | $(-13 \ldots 158)$ |  |

The following relative humidity is permissible during transportation and storage:

| Relative humidity (non-condensing) | $\%$ | $5 \ldots 95$ |
| :--- | :--- | :--- |
| Vibration and shock during transportation and <br> storage  As per IEC 60721-3-2, class 2M2 |  |  | |  |
| :--- |

## Conditions for Operation

The maximum permissible ambient temperature during operation depends on the mounting distances between the devices and on the required power. Observe the pertinent instructions in the chapter Installation (see page 95).

| Ambient temperature without derating (no icing, non-condensing) | ${ }^{\circ} \mathrm{C}$ <br> $\left({ }^{\circ} \mathrm{F}\right)$ | $0 \ldots 40$ <br> $(32 \ldots 104)$ |
| :--- | :--- | :--- |
| Ambient temperature if all of the following conditions are met ${ }^{(1)}$ : <br> $\bullet$ Derating (torque) by 4\% per Kelvin <br> - Maximum installation altitude $1000 \mathrm{~m}(3281 \mathrm{ft})$ above m.s.l. | ${ }^{\circ} \mathrm{C}$ <br> $\left({ }^{\circ} \mathrm{F}\right)$ | $41 \ldots 65$ <br> $(105.8 \ldots 149)$ |

(1) Usage as per UL 508C requires compliance with the information provided in chapter Conditions for UL 508C (see page 45).

Example of derating at $50^{\circ} \mathrm{C}\left(122{ }^{\circ} \mathrm{F}\right)$ :

The following relative humidity is permissible during operation:

| Relative humidity (non-condensing) | $\%$ | $5 \ldots 95$ |
| :--- | :--- | :--- |

The installation altitude is defined as altitude above mean sea level.

| Installation altitude without derating | m <br> (ft) | $\begin{aligned} & <1000 \\ & (<3281) \end{aligned}$ |
| :---: | :---: | :---: |
| Installation altitude if all of the following conditions are met: <br> - $45^{\circ} \mathrm{C}\left(113^{\circ} \mathrm{F}\right)$ maximum ambient temperature <br> - Reduction of the continuous power by $1 \%$ per $100 \mathrm{~m}(328 \mathrm{ft})$ above $1000 \mathrm{~m}(3281 \mathrm{ft})$ | m <br> (ft) | $\begin{aligned} & 1000 \ldots 2000 \\ & (3281 \ldots .6562) \end{aligned}$ |
| Installation altitude above mean sea level if all of the following conditions are met: <br> - $40^{\circ} \mathrm{C}\left(104^{\circ} \mathrm{F}\right)$ maximum ambient temperature <br> - Reduction of the continuous power by $1 \%$ per $100 \mathrm{~m}(328 \mathrm{ft})$ above $1000 \mathrm{~m}(3281 \mathrm{ft})$ <br> - Overvoltages of the supply mains limited to overvoltage category II as per IEC 60664-1 <br> - No IT mains | m <br> (ft) | $\begin{aligned} & 2000 \ldots 3000 \\ & (6562 \ldots 9843) \end{aligned}$ |

| Vibration and shock during operation |  | As per IEC 60721-3-3 <br> Class 3M4 |
| :--- | :--- | :--- |

## Degree of Protection

The requires all parts to be correctly mounted, see chapter Installation (see page 95), and the cover of the commissioning interface to be closed (IP as per IEC 60529):

| Degree of Protection without shaft sealing ring | IP $54^{(1)}$ |
| :--- | :--- |
| Degree of protection with shaft sealing ring | IP $65^{(1)(2)}$ |

(1) In the case of mounting position IM V3 (shaft vertical, shaft end upward), the degree of protection is IP 50. The degree of protection does not relate to mounted components such as, for example, a gearbox.
(2) The maximum speed of rotation is limited to 6000 rpm . The shaft sealing ring is factory-pre-lubricated. If the seals run dry, this increases friction and greatly reduces the service life of the sealing rings.

## Dimensions

Dimensions BMIO70

| BMI |  | 0702 | 0703 |
| :--- | :--- | :--- | :--- |
| L without holding brake | $\mathrm{mm}(\mathrm{in})$ | $268(10.55)$ | $300(11.81)$ |
| L with holding brake | $\mathrm{mm}(\mathrm{in})$ | $306(12.05)$ | $339(13.35)$ |
| L1 without holding brake | $\mathrm{mm}(\mathrm{in})$ | $127(5)$ | $159(6.26)$ |
| L1 with holding brake | $\mathrm{mm}(\mathrm{in})$ | $166(6.54)$ | $198(7.8)$ |
| B | $\mathrm{mm}(\mathrm{in})$ | $23(0.91)$ | $30(1.18)$ |
| C | $\mathrm{mm}(\mathrm{in})$ | $11(0.43)$ | $14(0.55)$ |
| D | $\mathrm{mm}(\mathrm{in})$ | $4(0.16)$ | $5(0.2)$ |
| E | $\mathrm{mm}(\mathrm{in})$ | $12.5(0.49)$ | $16(0.63)$ |
| F | $\mathrm{mm}(\mathrm{in})$ | $18(0.71)$ | $20(0.79)$ |

| P | mm (in) | 16 (0.63) | 16 (0.63) |
| O | mm (in) | 5 (0.2) | 5 (0.2) |
| N | mm (in) | 2.8 (0.11) | 2.8 (0.11) |

## General Characteristics

| Number of pairs of poles | 5 |  |
| :--- | :--- | :--- |
| Thermal class | $\mathrm{F}\left(155^{\circ} \mathrm{C}\right)$ | As per IEC 60034-1 |
| Vibration grade | A | As per IEC 60034-14 |
| Shaft extension run-out $/$ <br> perpendicularity | Class N (normal class) | As per IEC 60072-1, DIN 42955 |
| Housing color | Black RAL 9005 |  |

## Mains Voltage: Range and Tolerance

| $115 / 230$ Vac single-phase | Vac | $100-15 \% \ldots 120+10 \%$ <br> $200-15 \% \ldots 240+10 \%$ |
| :--- | :--- | :--- |
| $208 / 400 / 480$ Vac three-phase | Vac | $200-15 \% \ldots 240+10 \%$ <br> $380-15 \% \ldots 480+10 \%$ |
| Frequency | Hz | $50-5 \% \ldots 60+5 \%$ |

| Transient overvoltages |  | Overvoltage category III ${ }^{(1)}$ |
| :--- | :--- | :--- |
| Rated voltage to ground | Vac | 300 |
| (1) Depends on installation altitude, see chapter Environmental Conditions (see page 22). |  |  |

## Type of Grounding

| TT grounding system, TN grounding system | Permissible |
| :--- | :--- |
| IT mains | Permissible ${ }^{(1)}$ |
| Mains with corner grounded system | Not permitted |
| (1) Depending on the installation altitude, see chapter Environmental Conditions (see page 22). |  |

## Leakage Current

| Leakage current (as per IEC 60990, figure 3) | mA | $<30^{(1)}$ |
| :--- | :--- | :--- |

(1) Measured on mains with grounded neutral point and without external mains filter. Take into account that a 30 mA RCD can already trigger at 15 mA . In addition, there is a high-frequency leakage current which is not considered in the measurement. The response to this depends on the type of residual current device.

Harmonic Currents and Impedance
The harmonic currents depend on the impedance of the supply mains. This is expressed in terms of the short-circuit current of the supply mains. If the supply mains has a higher short-circuit current than indicated in the Technical Data for the device, use upstream mains reactors.

## Monitoring the Continuous Output Current

The continuous output current is monitored by the device. If the continuous output current is exceeded, the device reduces the output current.

PWM Frequency Power Stage
The PWM frequency of the power stage is set to a fixed value.

| PWM frequency power stage | kHz | 8 |
| :--- | :--- | :--- |

Service Life

| Nominal bearing service life $L_{10 h}{ }^{(1)}$ | $h$ | 20000 |
| :--- | :--- | :--- |

(1) Operating hours at a probability of failure of $10 \%$

The service life of the motors when operated correctly is limited primarily by the service life of the rolling bearing.
The following operating conditions significantly reduce the service life:

- Installation altitude $>1000 \mathrm{~m}(3281 \mathrm{ft})$ above mean sea level
- Rotary movements exclusively within a fixed angle of $<100^{\circ}$
- Operation under vibration load $>20 \mathrm{~m} / \mathrm{s}^{2}$
- Allowing sealing rings to run dry
- Contact of the seals with aggressive substances

## Shaft Sealing Ring / Degree of Protection

The motors can be equipped with an optional shaft sealing ring. With a shaft sealing ring, they have degree of protection IP65. The shaft sealing ring limits the maximum speed of rotation to 6000 rpm .

## Note the following:

- The shaft sealing ring is factory-pre-lubricated.
- If the seals run dry, this increases friction and greatly reduces the service life of the sealing rings.

## Signals

Logic Type
Observe the information concerning the logic type in chapter Logic Type (see page 57).
The connection modules can support either positive or negative logic, depending on the module reference For modules featuring M8/M12 connectors, the logic type is determined by the specific reference of the module. For modules featuring spring connectors, the logic type is determined by the wiring to the connector

Signal inputs are protected against reverse polarity, outputs are short-circuit protected. The inputs and outputs are functionally isolated.

Internal 24 V Signal Power Supply
The internal 24 V signal power supply is short-circuit protected and meets the PELV requirements.

| Nominal voltage | Vdc | 24 |
| :--- | :--- | :--- |
| Voltage range | Vdc | $23 \ldots 28$ |
| Maximum current +24 VDC | mA | 200 |
| Residual ripple |  | $<5 \%$ |

The reference potential 0VDC is grounded internally, see IEC 60204-1 (ground faults).
Do not ground the internal supply voltage by grounding any 0 V signal wiring outside the drive to help avoid ground loops.

The short-circuit protection can be reset by removing the short-circuit and by a power cycle of the drive (error with error class 4).

External 24 V Signal Power Supply
Signals can be supplied with voltage either by means of an external power supply unit or the internal signal power supply (see internal 24 V signal power supply). The voltage must meet the requirements of IEC 61131-2 (PELV standard power supply unit):

| Voltage | Vdc | 24 |
| :--- | :--- | :--- |
| Voltage tolerance | Vdc | 19.2 to 30 |
| Residual ripple |  | $<5 \%$ |

Digital Input Signals 24 V
When wired as positive logic, the levels of the digital inputs comply with IEC 61131-2, type 1 . The electrical characteristics are also valid when wired as negative logic unless otherwise indicated.

| Input voltage - positive logic Level 0 Level 1 | Vdc Vdc | $\begin{aligned} & -3 \ldots 5 \\ & 15 \ldots 30 \end{aligned}$ |
| :---: | :---: | :---: |
| Input voltage - negative logic (at 24 Vdc ) <br> Level 0 <br> Level 1 | Vdc <br> Vdc | $\begin{aligned} & >19 \\ & <9 \end{aligned}$ |
| Input current (at 24 Vdc ) | mA | 2.5 |
| Debounce time (software) ${ }^{(1)(2)}$ | ms | 1.5 (default value) |
| Hardware switching time Rising edge (level $0->1$ ) Falling edge (level $1->0$ ) | $\begin{aligned} & \mu \mathrm{s} \\ & \mu \mathrm{~s} \end{aligned}$ | $\begin{aligned} & 15 \\ & 150 \end{aligned}$ |
| Jitter (capture inputs) | $\mu \mathrm{s}$ | <2 |
| (1) Adjustable via parameter (sampling period $250 \mu \mathrm{~s}$ ) <br> (2) If the capture inputs are used for capture then the debounce time is not applie |  |  |

Digital Output Signals 24 V
When wired as positive logic, the levels of the digital outputs comply with IEC 61131-2. The electrical characteristics are also valid when wired as negative logic unless otherwise indicated.

| Nominal supply voltage (for modules with spring <br> terminals) | Vdc | 24 |
| :--- | :--- | :--- |
| Voltage range for supply voltage (for modules <br> with spring terminals) | Vdc | $19.2 \ldots 30$ |
| Nominal output voltage - positive logic | Vdc | 24 |
| Nominal output voltage - negative logic | Vdc | 0 |
| Voltage drop at 50 mA load | Vdc | $\leq 1$ |
| Maximum current per output ${ }^{(1)}$ | mA | 100 |
| Maximum inductive load | mH | 1000 |
| (1) Load resistance between $0.3 \ldots 50 \mathrm{k} \Omega$. |  |  |

The short circuit protection can be reset by switching off the supply voltage.

## Input Signals Safety Function STO

The inputs for the safety function STO (inputs STO_A and STO_B) can only be wired for positive logic. Observe the information provided in chapter Safety function STO ("Safe Torque Off") (see page 69).

| Input voltage - positive logic <br> Level 0 <br> Level 1 | Vdc | $-3 \ldots 5$ |
| :--- | :--- | :--- |
| Vdc | $15 \ldots 30$ |  |$|$| 15 mA | 2.5 |
| :--- | :--- |
| Input current (at 24 Vdc) | ms |
| Debounce time STO_A and STO_B | $>1$ |
| Detection of signal differences between STO_A <br> and STO_B | s |
| Response time of safety function STO | ms |

## Shaft-Specific Data

Overview
Motor shafts may be subject to premature wear, breakage, or extended damage to the encoder if the maximum force ratings of the motor shaft are exceeded.

## A CAUTION <br> UNINTENDED EQUIPMENT OPERATION DUE TO MECHANICAL DAMAGE TO THE MOTOR

- Do not exceed the maximum axial and radial forces at the motor shaft.
- Protect the motor shaft from impact.
- Do not exceed the maximum axial force when pressing components onto the motor shaft.

Failure to follow these instructions can result in injury or equipment damage.

Point of application of the forces:

## Force for Pressing On

The force applied during pressing on must not exceed the maximum permissible axial force. Applying assembly paste to the shaft and the component to be mounted reduces friction and mechanical impact on the surfaces.
If the shaft has a thread, use it to press on the component to be mounted. This way there is no axial force acting on the rolling bearing.
It is also possible to shrink-fit, clamp or glue the component to be mounted.
The following table shows the maximum permissible axial force $F_{A}$ at standstill.

| BMI... |  | 070 | 100 |
| :--- | :--- | :--- | :--- |
| Maximum permissible axial force $\mathrm{F}_{\mathrm{A}}$ at <br> standstill | N (lbf) | $80(18)$ | $160(36)$ |

The following conditions apply:

- The permissible force applied during pressing on must not be exceed.
- Radial and axial limit loads must not be applied simultaneously
- Nominal bearing service life in operating hours at a probability of failure of $10 \%\left(\mathrm{~L}_{10 \mathrm{~h}}=20000\right.$ hours $)$
- Mean speed of rotation $n=4000 \mathrm{rpm}$
- Ambient temperature $=40^{\circ} \mathrm{C}\left(104^{\circ} \mathrm{F}\right)$
- Peak torque = Duty types S3-S8,10\% duty cycle
- Nominal torque = Duty type S1, $100 \%$ duty cycle

The point of application of the forces depends on the motor size:

| BMI... |  | 0702 | 0703 | 100 |
| :--- | :--- | :--- | :--- | :--- |
| Values for "X" | $\mathrm{mm}($ in $)$ | $11.5(0.45)$ | $15(0.59)$ | $20(0.79)$ |

The following table shows the maximum radial shaft load $F_{R}$.

| BMI... |  | 0702 | 0703 | 1002 | 1003 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1000 rpm | N (lbf) | $710(160)$ | $730(164)$ | $990(223)$ | $1050(236)$ |
| 2000 rpm | N (lbf) | $560(126)$ | $580(130)$ | $790(178)$ | $830(187)$ |
| 3000 rpm | $\mathrm{N}(\mathrm{lbf})$ | $490(110)$ | $510(115)$ | $690(155)$ | $730(164)$ |
| 4000 rpm | N (lbf) | $450(101)$ | $460(103)$ | $620(139)$ | $660(148)$ |
| 5000 rpm | N (lbf) | $410(92)$ | $430(97)$ | $580(130)$ | $610(137)$ |
| 6000 rpm | $\mathrm{N}(\mathrm{lbf})$ | $390(88)$ | $400(90)$ | - | - |

The following table shows the maximum axial shaft load $\mathrm{F}_{\mathrm{A}}$ during rotation.

| BMI... |  | 0702 | 0703 | 1002 | 1003 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1000 rpm | N (lbf) | $142(32)$ | $146(33)$ | $198(45)$ | $210(47)$ |
| 2000 rpm | N (lbf) | $112(25)$ | $116(26)$ | $158(36)$ | $166(37)$ |
| 3000 rpm | N (lbf) | $98(22)$ | $102(23)$ | $138(31)$ | $146(33)$ |
| 4000 rpm | N (lbf) | $90(20)$ | $92(21)$ | $124(28)$ | $132(30)$ |
| 5000 rpm | N (lbf) | $82(18)$ | $86(19)$ | $116(26)$ | $122(27)$ |
| 6000 rpm | N (lbf) | $78(18)$ | $80(18)$ | - | - |

The holding brake in the motor has the task of holding the motor position when the power stage is disabled. The holding brake is not a safety-related function and not a service brake.

## A WARNING

## UNINTENDED AXIS MOVEMENT

- Do not use the internal holding brake as a safety-related measure.
- Only use certified external brakes as safety-related measures.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

| BMI... |  | 070 | 1002 | 1003 |
| :--- | :--- | :--- | :--- | :--- |
| Holding torque ${ }^{(1)}$ | Nm | 3.0 | 5.5 | 9 |
| Opening time | ms | 80 | 70 | 90 |
| Coupling time | ms | 17 | 30 | 40 |
| Maximum speed of rotation during braking of moving <br> loads | rpm | 3000 | 3000 | 3000 |
| Maximum number of decelerations during braking of <br> moving loads and 3000 rpm |  | 500 | 500 | 500 |
| Maximum number of decelerations during braking of <br> moving loads per hour at even distribution | 20 | 20 | 20 |  |
| Maximum kinetic energy that can be transformed into <br> heat per deceleration during braking of moving loads | J | 130 | 150 | 150 |

(1) The holding brake is broken-in at the factory. If the holding brake is not used for an extended period of time, parts of the holding brake may corrode. Corrosion reduces the holding torque.

## Encoder

SKS36 Singleturn
This motor encoder measures an absolute value within one revolution at start-up and continues to count incrementally from this point.

| Resolution in increments | Depending on evaluation |
| :--- | :--- |
| Resolution per revolution | $128 \mathrm{sin} /$ cos periods |
| Measuring range absolute | 1 revolution |
| Accuracy of digital absolute value | $\pm 0.0889^{\circ}$ |
| Accuracy of the incremental <br> position | $\pm 0.0222^{\circ}$ |
| Maximum angular acceleration | $200000 \mathrm{rad} / \mathrm{s}^{2}$ |

SKM36 Multiturn
This motor encoder measures an absolute value within 4096 revolutions at start-up and continues to count incrementally from this point.

| Resolution in increments | Depending on evaluation |
| :--- | :--- |
| Resolution per revolution | $128 \mathrm{sin} / \mathrm{cos}$ periods |
| Measuring range absolute | 4096 revolutions |
| Accuracy of digital absolute value | $\pm 0.0889^{\circ}$ |
| Accuracy of the incremental <br> position | $\pm 0.0222^{\circ}$ |
| Maximum angular acceleration | $200000 \mathrm{rad} / \mathrm{s}^{2}$ |

## SEK37 Singleturn

This motor encoder measures an absolute value within one revolution at start-up and continues to count incrementally from this point.

| Resolution in increments | Depending on evaluation |
| :--- | :--- |
| Resolution per revolution | $16 \mathrm{sin} / c o s$ periods |
| Measuring range absolute | 1 revolution |
| Accuracy of position | $\pm 0.08^{\circ}$ |

SEL37 Multiturn
This motor encoder measures an absolute value within 4096 revolutions at start-up and continues to count incrementally from this point.

| Resolution in increments | Depending on evaluation |
| :--- | :--- |
| Resolution per revolution | $16 \sin / \cos$ periods |
| Measuring range absolute | 4096 revolutions |
| Accuracy of position | $\pm 0.08^{\circ}$ |

## Braking Resistor

## Data for Calculation of the Braking Resistor

The product is shipped with a standard braking resistor. If the braking resistor is not sufficient for the dynamics requirements of the applications, it must be replaced with an external braking resistor.
The resistance values for external braking resistors must not be below the specified minimum resistance.

| (1) Resistors with a continuous power of 400 W are not UL/CSA-approved. |  |  |  |  |  |  |  |

## Electromagnetic Emission

## Overview

The products described in the present manual meet the EMC requirements as per IEC 61800-3 if the EMC measures described in the present manual are implemented.

## A WARNING <br> ELECTROMAGNETIC DISTURBANCES OF SIGNALS AND DEVICES <br> Use proper EMC shielding techniques to help prevent unintended device operation in accordance with the standard IEC 61800-3. <br> Failure to follow these instructions can result in death, serious injury, or equipment damage.

If the overall configuration (drive, mains filter, cables, additional accessories as well as all EMC mitigation measures implemented) does not meet the requirements of category C1 as per IEC 61800-3, this may cause radio interference in domestic electrical networks.

## A WARNING

## RADIO INTERFERENCE

- Verify compliance with all applicable EMC standards, and, in particular, but not limited to, IEC 618003.
- Do not operate this equipment with a configuration of category C3 or C4 in a first environment as defined in IEC 61800-3
- Implement all required radio interference suppression measures, as described in this document, and verify their effectiveness.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

NOTE: The following information as per IEC 61800-3 applies if you operate this equipment with a configuration which does not meet the limits of category C1:
"In a domestic environment this product may cause radio interference in which case supplementary mitigation measures may be required."

As a machine designer or system integrator, you may need to include this information in the documentation to your customer

The following categories for emission as per IEC 61800-3 are reached if the EMC measures described in the present manual are implemented.

| Emission type | Category |
| :--- | :--- |
| Conducted emission | Category C2 |
| Radiated emission | Category C2 |

## Tightening Torque of Screws and Cable Glands

Tightening Torque and Property Class of Screws

| Tightening torque of the fastening screw for LXM32i to BMi M5 $\times 25^{(1)}$ | $\mathrm{Nm}(\mathrm{lb} \cdot \mathrm{in})$ | $5.0(44.25)$ |
| :--- | :--- | :--- |
| Tightening torque of the fastening screws for the supply voltage module M4 $\times 16^{(1)}$ | $\mathrm{Nm}(\mathrm{lb} \cdot \mathrm{in})$ | $1.4(12.39)$ |
| Tightening torque of the fastening screws for the standard braking resistor M4 $\times 16^{(1)}$ | $\mathrm{Nm}(\mathrm{lb} \cdot \mathrm{in})$ | $1.4(12.39)$ |
| Tightening torque of the fastening screws for the connection module of the external <br> braking resistor M4 $\times 16^{(1)}$ | $\mathrm{Nm}(\mathrm{lb} \cdot \mathrm{in})$ | $1.4(12.39)$ |
| Tightening torque of the fastening screw for the I/O module M4 $\times 16^{(1)}$ | $\mathrm{Nm}(\mathrm{lb} \cdot \mathrm{in})$ | $1.4(12.39)$ |
| Tightening torque of the industrial connectors for the I/O module M8 | $\mathrm{Nm}(\mathrm{lb} \cdot \mathrm{in})$ | $0.2(1.77)$ |
| Tightening torque of the industrial connectors for the I/O module M12 | $\mathrm{Nm}(\mathrm{lb} \cdot \mathrm{in})$ | $0.4(3.54)$ |
| Property class | H | 8.8 |
| $(1)$ Washer required |  |  |

Tightening Torque of Cable Glands
The specified tightening torques are maximum values for compression nuts. Keep tightening the compression nut until the tightening torque as per table is reached or until the sealing insert forms a small hump protruding over the compression nut. The cable gland bodies must be tightened with the maximum tightening torque for the appropriate thread size; the threads must be locked to help avoid unintended loosening, if necessary.

Use genuine accessories or cable glands with a degree of protection of at least IP65 (form sealing ring or flat sealing ring required).

| Tightening torque of cable gland $\mathrm{M} 12 \times 1.5 \times 6$ (body) | $\mathrm{Nm}(\mathrm{lb} \cdot \mathrm{in})$ | $1.5(13.28)$ |
| :--- | :--- | :--- |
| Tightening torque of cable gland M 12 (compression nut) | $\mathrm{Nm}(\mathrm{lb} \cdot \mathrm{in})$ | $1.0(8.85)$ |
| Tightening torque of cable gland $\mathrm{M} 16 \times 1.5 \times 6$ (cable gland body) | $\mathrm{Nm}(\mathrm{lb} \cdot \mathrm{in})$ | $3.0(26.55)$ |
| Tightening torque of cable gland M 16 (compression nut) | $\mathrm{Nm}(\mathrm{lb} \cdot \mathrm{in})$ | $2.0(17.70)$ |
| Tightening torque of cable gland M 20 (compression nut) | $\mathrm{Nm}(\mathrm{lb} \cdot \mathrm{in})$ | $4.0(35.40)$ |

## Non-Volatile Memory and Memory Card

## Non-Volatile Memory

The following table shows characteristics for the non-volatile memory:

| Characteristic | Value |
| :--- | :--- |
| Minimum number of writing cycles | 100000 |
| Type | EEPROM |

Memory Card
The following table shows characteristics for the memory card:

| Characteristic | Value |
| :--- | :--- |
| Minimum number of writing cycles | 100000 |
| Minimum number of plug-in cycles | 1000 |

Memory Card Holder
The following table shows characteristics for the memory card holder:

| Characteristic | Value |
| :--- | :--- |
| Minimum number of plug-in cycles | 5000 |

## Certifications

Product certifications:

| TÜV Nord | SLA-0046/2010 |
| :--- | :--- |
| UL | E363147 |

## Conditions for UL 508C

If the product is used to comply with UL 508C, the following conditions must also be met:

## Ambient Temperature During Operation

| Surrounding air temperature | ${ }^{\circ} \mathrm{C}\left({ }^{\circ} \mathrm{F}\right)$ | $0 \ldots 40(32 \ldots 104)$ |
| :--- | :--- | :--- |

## Fuses

Use fuses as per UL 248.

| Maximum fuse rating of fuse to be connected <br> upstream | A | 25 |
| :--- | :--- | :--- |
| Class |  | CC or J |

Wiring
Use at least $60 / 75{ }^{\circ} \mathrm{C}\left(140 / 167{ }^{\circ} \mathrm{F}\right)$ copper conductors.

400/480 V Three-Phase Devices
400/480 V three-phase devices may only be operated via mains up to 480Y/277 Vac.

Overvoltage Category
"Use only in overvoltage category III or where the maximum available Rated Impulse Withstand Voltage Peak is equal or less than 4000 Volts.", or equivalent.

Motor Overload Protection
This equipment provides Solid State Motor Overload Protection at 200 \% of maximum FLA (Full Load Ampacity).

Components
Use only UL-listed components (for example, cable glands).

## Chapter 3

## Engineering

What Is in This Chapter?
This chapter contains the following sections:

| Section | Topic | Page |
| :--- | :--- | :---: |
| 3.1 | Electromagnetic Compatibility (EMC) | 48 |
| 3.2 | Cables and Signals | 52 |
| 3.3 | Mains Supply | 60 |
| 3.4 | Rating the Braking Resistor | 63 |
| 3.5 | Functional Safety | 69 |
| 3.6 | PROFINET Fieldbus | 81 |

## Section 3.1

## Electromagnetic Compatibility (EMC)

What Is in This Section?
This section contains the following topics:

| Topic | Page |
| :--- | :---: |
| General | 49 |
| Deactivating the Y Capacitors | 51 |

## General

## EMC-Compliant Wiring

This product meets the EMC requirements according to the standard IEC 61800-3 if the measures described in this manual are implemented during installation.
Signal interference can cause unexpected responses of the drive system and of other equipment in the vicinity of the drive system.

## A WARNING

## SIGNAL AND EQUIPMENT INTERFERENCE

- Install the wiring in accordance with the EMC requirements described in the present document.
- Verify compliance with the EMC requirements described in the present document
- Verify compliance with all EMC regulations and requirements applicable in the country in which the product is to be operated and with all EMC regulations and requirements applicable at the installation site.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## A WARNING <br> ELECTROMAGNETIC DISTURBANCES OF SIGNALS AND DEVICES <br> Use proper EMC shielding techniques to help prevent unintended device operation in accordance with the standard IEC 61800-3.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

See chapter Electromagnetic Emission (see page 41) for the EMC categories.

| EMC measures | Objective |
| :--- | :--- |
| Connect large surface areas of cable shields, use <br> cable clamps and ground straps. | Reduces emissions. |
| Ground shields of digital signal wires at both ends by <br> connecting them to a large surface area or via <br> conductive connector housings. | Reduces interference affecting the signal wires, <br> reduces emissions. |

Cable Installation

| EMC measures | Objective |
| :--- | :--- |
| Do not route fieldbus cables and signal wires in a <br> single cable duct together with lines with DC and AC <br> voltages of more than 60 V . (Fieldbus cables, signal <br> lines and analog lines may be in the same cable duct) <br> Recommendation: Use separate cable ducts at least <br> 20 cm apart. | Reduces mutual interference. |
| Keep cables as short as possible. Do not install <br> unnecessary cable loops, use short cables from the <br> central grounding point in the control cabinet to the <br> external ground connection. | Reduces capacitive and inductive interference. |
| Use equipotential bonding conductors in the following <br> cases: wide-area installations, different voltage <br> supplies and installation across several buildings. | Reduces current in the cable shield, reduces |
| emissions. |  |
| Use fine stranded equipotential bonding conductors. | Diverts high-frequency interference currents. |
| for example by an insulated flange or a connection |  |
| without surface contact, you must ground the motor |  |
| with a ground strap or a ground wire. The conductor |  | Reduces emissions, increases immunity..

Power Supply

| EMC measures | Objective |
| :--- | :--- |
| Operate product on mains with grounded neutral <br> point. | Enables effectiveness of mains filter. |
| Surge arrester if there is a risk of overvoltage. | Reduces the risk of damage caused by overvoltage. |

Additional Measures for EMC Improvement
Depending on the application, the following measures can improve the EMC-dependent values:

| EMC measures | Objective |
| :--- | :--- |
| Use mains reactors | Reduces mains harmonics, prolongs product service <br> life. |

## Deactivating the Y Capacitors

The ground connections of the internal $Y$ capacitors can be disconnected (deactivation). Usually, it is not required to deactivate the ground connection of the $Y$ capacitors.

To deactivate the Y capacitors, remove the screw. Keep this screw so you can re-activate the Y capacitors, if required.

The EMC limit values specified no longer apply if the $Y$ capacitors are deactivated.

## Section 3.2

## Cables and Signals

What Is in This Section?
This section contains the following topics:

| Topic | Page |
| :--- | :---: |
| Cables - General | 53 |
| Overview of the Required Cables | 55 |
| Wiring Concept | 56 |
| Logic Type | 57 |
| Configurable Inputs and Outputs | 58 |
| Mounting Types of The Modules | 59 |

## Cables - General

## Suitability of the Cables

Cables must not be twisted, stretched, crushed or bent. Use only cables that comply with the cable specification. Consider the following in determining suitability of the cables:

- Suitable for drag chain applications
- Temperature range
- Chemical resistance
- Outdoor installation
- Underground installation

Connecting Shields
Shield connection possibilities:

- I/O module with industrial connectors: Connect shield to connector housing
- I/O module with spring terminals: The shields are connected in the housing cover by means of shield clips.

## Equipotential Bonding Conductors

Potential differences can result in excessive currents on the cable shields. Use equipotential bonding conductors to reduce currents on the cable shields. The equipotential bonding conductor must be rated for the maximum current.

| WNARNING |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| - Ground cable shields for all fast I/O, analog I/O, and communication signals at a single point. ${ }^{1)}$ |
| - Route communications and I/O cables separately from power cables. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

[^0]
## Conductor Cross Sections According to Method of Installation

The following sections describe the conductor cross sections for two methods of installation:

- Method of installation B2:

Cables in conduits or cable trunking systems

- Method of installation E:

Cables on open cable trays

| Cross section in $\mathrm{mm}^{2}$ <br> (AWG) | Current-carrying capacity with method of installation $B 2$ in $A^{(1)}$ | Current carrying capacity with method of installation $E$ in $A^{(1)}$ |
| :---: | :---: | :---: |
| 0.75 (18) | 8.5 | 10.4 |
| 1 (16) | 10.1 | 12.4 |
| 1.5 (14) | 13.1 | 16.1 |
| 2.5 (12) | 17.4 | 22 |
| 4 (10) | 23 | 30 |
| 6 (8) | 30 | 37 |
| 10 (6) | 40 | 52 |
| 16 (4) | 54 | 70 |
| 25 (2) | 70 | 88 |
| (1) Values as per IEC 60204-1 for continuous operation, copper conductors and ambient air temperature $40^{\circ} \mathrm{C}\left(104{ }^{\circ} \mathrm{F}\right)$. See IEC 60204-1 for additional information. The table is an excerpt from this standard and also shows cable cross-sections that are not applicable with regard to the product. |  |  |

Note the derating factors for grouping of cables and correction factors for other ambient conditions (IEC 60204-1).
The conductors must have a sufficiently large cross section so that the upstream fuse can trip.
In the case of longer cables, it may be necessary to use a greater conductor cross section to reduce the energy losses.

## Overview of the Required Cables

The properties of the required cables are listed in the table below. Use pre-assembled cables to reduce the risk of wiring errors. Pre-assembled cables can be found in chapter Accessories and Spare Parts (see page 475). If the product is used to comply with the requirements as per UL 508C, the conditions specified in chapter Conditions for UL 508C (see page 45) must be met.
Moving cables must be fastened (for example, to a drag chain) so that the movement of the cable cannot act on the cable gland.

|  | Maximum cable length | Minimum cable diameter (1) | Maximum cable diameter ${ }^{(1)}$ | Minimum conductor cross section | Shield | Twisted pair | PELV |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Mains voltage | - | $\begin{aligned} & 8 \mathrm{~mm} \\ & (0.31 \mathrm{in}) \end{aligned}$ | $\begin{aligned} & 15 \mathrm{~mm} \\ & (0.59 \mathrm{in}) \\ & \hline \end{aligned}$ | -(2) | - | - | - |
| Digital inputs / outputs | $\begin{aligned} & 30 \mathrm{~m} \\ & (98.4 \mathrm{ft}) \end{aligned}$ | $\begin{aligned} & 2.5 \mathrm{~mm} \\ & (0.1 \mathrm{in}) \\ & \text { (for UL: } \\ & 5 \mathrm{~mm} \\ & (0.2 \mathrm{in}) \text { ) } \end{aligned}$ | $\begin{aligned} & 6.5 \mathrm{~mm} \\ & (0.26 \mathrm{in}) \end{aligned}$ | $\begin{aligned} & 0.14 \mathrm{~mm}^{2} \\ & \text { (AWG } 24 \text { ) } \end{aligned}$ | - | - | Required |
| Safety function $\mathrm{STO}^{(3)}$ | - | $\begin{aligned} & 2.5 \mathrm{~mm} \\ & \text { ( } 0.1 \mathrm{in} \text { ) } \\ & \text { (for UL: } \\ & 5 \mathrm{~mm} \\ & (0.2 \mathrm{in}) \text { ) } \end{aligned}$ | $\begin{aligned} & 6.5 \mathrm{~mm} \\ & (0.26 \mathrm{in}) \end{aligned}$ | $\begin{aligned} & 0.34 \mathrm{~mm}^{2} \\ & \text { (AWG 20) } \end{aligned}$ | Required, one end grounded | - | Required |
| PC, commissioning interface | 100 m (328 ft) | - | - | $\begin{aligned} & 0.25 \mathrm{~mm}^{2} \\ & \text { (AWG } 22 \text { ) } \end{aligned}$ | Required, both ends grounded | Required | Required |
| External braking resistor | 3 m (9.84 ft) | $\begin{aligned} & 6 \mathrm{~mm} \\ & (0.24 \mathrm{in}) \end{aligned}$ | $\begin{aligned} & 10.5 \mathrm{~mm} \\ & (0.41 \mathrm{in}) \end{aligned}$ | Same as mains voltage | Required, both ends grounded | - | - |

(1) Clamping range of the cable glands.
(2) See chapter Conductor Cross Sections According to Method of Installation (see page 54)
(3) See chapter Protected Cable Installation for Safety-Related Signals (see page 77).

## Wiring Concept

Note the following for wiring the product:

- Use a PLC with galvanically isolated inputs and outputs in the case of internal signal power supply.
- The supply voltage for signals (PELV) may only be grounded at a single point. If the supply voltage is grounded at several points, this will result in ground loops.

## Logic Type

## Overview

The digital inputs and outputs of this product can be wired for positive logic or negative logic.

| Logic type | Active state |
| :--- | :--- |
| (1) Positive logic | Output supplies current (source output) <br> Current flows to the input (sink input) |
| (2) Negative logic | Output draws current (sink output) <br> Current flows from the input (source input) |

Signal inputs are protected against reverse polarity, outputs are short-circuit protected. The inputs and outputs are functionally isolated.
If negative logic is used, a ground fault of a signal is detected as an On state.

| $\mid \quad$ U WARNING |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| Verify that a short-circuit of a signal cannot cause unintended equipment operation. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

Connection Module with Industrial Connector
In the case of industrial connectors, the logic type is determined with the selection of the connection module.

Connection Module with Spring Terminals
The logic type is determined by the wiring of DI_COM and DQ_COM. The logic type affects wiring and control of the sensors; therefore, you must determine the required value in the engineering phase in view of the application.

Special Case: Safety Function STO
The inputs for the safety function STO (inputs STO A and STO B) can only be wired for positive logic.

## Configurable Inputs and Outputs

This product has digital inputs and outputs that can be configured for specific functional assignments. The inputs and outputs have a defined standard assignment depending on the operating mode. This assignment can be adapted to the requirements of the customer's installation. See chapter Digital Inputs and Outputs (see page 209) for additional information.

## Mounting Types of The Modules

Select the installation of the modules according to the required interfaces and the connection direction. Also note that the modules require space for mounting.

## Mounting Type with Standard Braking Resistor

Mounting type A
Module for supply voltage in slot 1
Standard braking resistor slot 2
I O module in slot 3A

## Mounting Types with External Braking Resistor

Mounting type C

| Module for supply voltage in slot 1 |
| :--- |
| External braking resistor in slot 2 |

$I / O$ module in slot 3A
Mounting type E

| Module for supply voltage in slot 2 |
| :--- |
| External braking resistor in slot 1 |
| IO module in slot 3A |

## Section 3.3 <br> Mains Supply

What Is in This Section?
This section contains the following topics:

| Topic | Page |
| :--- | :---: |
| Residual Current Device | 61 |
| Mains Reactor | 62 |

Direct current can be introduced in the protective ground conductor of this drive. If a residual current device (RCD / GFCI) or a residual current monitor (RCM) is used for protection against direct or indirect contact, the following specific types must be used:

## A WARNING

DIRECT CURRENT CAN BE INTRODUCED INTO THE PROTECTIVE GROUND CONDUCTOR

- Use a Type A Residual Current Device (RCD / GFCI) or a Residual Current Monitor (RCM) for singlephase drives connected to a phase and to the neutral conductor.
- Use a Type B Residual Current Device (RCD / GFCI) or a Residual Current Monitor (RCM) that has approval for use with frequency inverters and is sensitive to all types of current for three-phase devices and for single-phase devices not connected to a phase and the neutral conductor.
Failure to follow these instructions can result in death, serious injury, or equipment damage.
Further conditions for use of a residual current device:
- The drive has an increased leakage current at the moment power is applied. Use a residual current device (RCD / GFCI) or a residual current monitor (RCM) with a response delay.
- High-frequency currents must be filtered.

Mains Reactor

A mains reactor must be used under the following conditions:

- Operation via supply mains with low impedance (short-circuit current of supply mains greater than specified in chapter Technical Data (see page 21).
- In the case of operation with supply mains with reactive power compensation systems.
- For improvement of the power factor at the mains input and for reduction of mains harmonics.

A single mains reactor can be used for multiple devices. Use a mains reactor with a properly rated current.
Low-impedance supply mains cause high harmonic currents at the mains input. High harmonic currents result in considerable load on the DC bus capacitors. The load on the DC bus capacitors has a decisive impact on the service life of the devices.

## Section 3.4

## Rating the Braking Resistor

What Is in This Section?
This section contains the following topics:

| Topic | Page |
| :--- | :---: |
| Standard Braking Resistor | 64 |
| External Braking Resistor | 65 |
| Rating Information | 66 |

## Standard Braking Resistor

The drive is equipped with a standard braking resistor to absorb braking energy.
Braking resistors are required for dynamic applications. During deceleration, the kinetic energy is transformed into electrical energy in the motor. The electrical energy increases the DC bus voltage. The braking resistor is activated when the defined threshold value is exceeded. The braking resistor transforms electrical energy into heat. If highly dynamic deceleration is required, the braking resistor must be well adapted to the system.

An insufficiently rated braking resistor can cause overvoltage on the DC bus. Overvoltage on the DC bus causes the power stage to be disabled. The motor is no longer actively decelerated.

## A WARNING

UNINTENDED EQUIPMENT OPERATION

- Verify that the braking resistor has a sufficient rating by performing a test run under maximum load conditions.
- Verify that the parameter settings for the braking resistor are correct.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## External Braking Resistor

An external braking resistor is required for applications in which the motor must be decelerated quickly and the standard braking resistor cannot absorb the excess braking energy.
The temperature of the braking resistor may exceed $250^{\circ} \mathrm{C}\left(482{ }^{\circ} \mathrm{F}\right)$ during operation.

## A WARNING

## HOT SURFACES

- Ensure that it is not possible to make any contact with a hot braking resistor.
- Do not allow flammable or heat-sensitive parts in the immediate vicinity of the braking resistor.
- Verify that the heat dissipation is sufficient by performing a test run under maximum load conditions.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Monitoring

The device monitors the power of the braking resistor. The load on the braking resistor can be read out.
The output for the external braking resistor is short-circuit protected. The drive does not monitor for ground faults of the braking resistor.

## Selection of the External Braking Resistor

The rating of an external braking resistor depends on the required peak power and continuous power. The resistance R is derived from the required peak power and the DC bus voltage.

$$
\mathrm{R}=\frac{\mathrm{U}^{2}}{\mathrm{P}_{\max }}
$$

## $\mathrm{R}=$ Resistance in $\Omega$

$\mathrm{U}=$ Switching threshold for braking resistor V
$P_{\text {max }}=$ Required peak power in W
If 2 or more braking resistors are connected to one drive, note the following criteria:

- The total resistance of all connected regenerative resistors must comply with the approved resistance.
- The braking resistors can be connected in parallel or in series. Only connect braking resistors with identical resistance in parallel in order to evenly distribute the load to the braking resistors.
- The total continuous power of all connected braking resistors result must be greater than or equal to the required continuous power.
Use only resistors that are specified as braking resistors. For suitable braking resistors, see chapter Accessories and Spare Parts (see page 475).

## Mounting and Commissioning of an External Braking Resistor

A parameter is used to switch between the standard braking resistor and an external braking resistor.
The external braking resistors listed in the Accessories chapter are shipped with an information sheet that provides details on installation.

## Rating Information

To rate the braking resistor, calculate the proportion contributing to absorbing braking energy.
An external braking resistor is required if the kinetic energy that must be absorbed exceeds the possible total internal energy absorption.

Internal Energy Absorption
Braking energy is absorbed internally by:

- DC bus capacitor $\mathrm{E}_{\mathrm{var}}$
- Standard braking resistor $\mathrm{E}_{1}$
- Electrical losses of the drive $\mathrm{E}_{\mathrm{el}}$
- Mechanical losses of the drive $\mathrm{E}_{\text {mech }}$

Values for the energy absorption $\mathrm{E}_{\mathrm{var}}$ can be found in chapter Braking Resistor (see page 39).

## Standard Braking Resistor

Two characteristic values determine the energy absorption of the standard braking resistor.

- The continuous power $\mathrm{P}_{\mathrm{PR}}$ is the amount of energy that can be continuously absorbed without overloading the braking resistor.
- The maximum energy $E_{C R}$ limits the maximum short-term power that can be absorbed.

If the continuous power was exceeded for a specific time, the braking resistor must remain without load for a corresponding period.

The characteristic values $\mathrm{P}_{\mathrm{PR}}$ and $\mathrm{E}_{\mathrm{CR}}$ of the standard braking resistor can be found in chapter Braking Resistor (see page 39).

## Electrical Losses $\mathrm{E}_{\mathrm{el}}$

The electrical losses $\mathrm{E}_{\mathrm{el}}$ of the drive system can be estimated on the basis of the peak power of the drive. The maximum power dissipation is approximately $10 \%$ of the peak power at a typical efficiency of $90 \%$. If the current during deceleration is lower, the power dissipation is reduced accordingly.

Mechanical Losses $\mathrm{E}_{\text {mech }}$
The mechanical losses result from friction during operation of the system. Mechanical losses are negligible if the time required by the system to coast to a stop without a driving force is considerably longer than the time required to decelerate the system. The mechanical losses can be calculated from the load torque and the velocity from which the motor is to stop.

Example
Deceleration of a rotary motor with the following data:

- Initial speed of rotation: $\mathrm{n}=4000 \mathrm{~min}^{-1}$
- Rotor inertia: $J_{\mathrm{R}}=4 \mathrm{kgcm}^{2}$
- Load inertia: $J_{\mathrm{L}}=6 \mathrm{kgcm}^{2}$
- Drive: $\mathrm{E}_{\mathrm{var}}=23 \mathrm{Ws}, \mathrm{E}_{\mathrm{CR}}=80 \mathrm{Ws}, \mathrm{P}_{\mathrm{PR}}=10 \mathrm{~W}$

Calculation of the energy to be absorbed:

$$
E_{B}=\frac{1}{2} \mathrm{~J} \cdot\left[\frac{2 \pi n}{60}\right]^{2}
$$

to $E_{B}=88 \mathrm{Ws}$. Electrical and mechanical losses are ignored.
In this example, the DC bus capacitors absorb $\mathrm{E}_{\mathrm{var}}=23 \mathrm{Ws}$ (the value depends on the device type).
The standard braking resistor must absorb the remaining 65 Ws . It can absorb a pulse of $\mathrm{E}_{\mathrm{CR}}=80 \mathrm{Ws}$. If the load is decelerated once, the standard braking resistor is sufficient.

If the deceleration is repeated cyclically, the continuous power must be taken into account. If the cycle time is longer than the ratio of the energy to be absorbed $E_{B}$ and the continuous power $P_{P R}$, the standard braking resistor is sufficient. If the system decelerates more frequently, the standard braking resistor is not sufficient.
In this example, the ratio of $E_{B} / P_{P R}$ is 8.8 s . An external braking resistor is required if the cycle time is shorter.

## Rating the External Braking Resistor

Characteristic curves for rating the braking resistor

These two characteristics are also used for the rating the motor. The segments of the characteristic curves to be considered are designated by $D_{i}\left(D_{1} \ldots D_{3}\right)$.

The total inertia $J_{t}$ must be known for the calculation of the energy at constant deceleration.
$J_{t}=J_{m}+J_{c}$
$J_{\mathrm{m}}$ : Motor inertia (with holding brake)
$J_{c}$ : Load inertia
The energy for each deceleration segment is calculated as follows:

$$
E_{i}=\frac{1}{2} J_{t} \cdot \omega_{i}^{2}=\frac{1}{2} J_{t} \cdot\left[\frac{2 \pi n_{i}}{60}\right]^{2}
$$

Calculation for the segments $\left(D_{1}\right) \ldots\left(D_{3}\right)$ :

$$
\begin{aligned}
& E_{1}=\frac{1}{2} J_{t} \cdot\left[\frac{2 \pi}{60}\right]^{2} \cdot\left[n_{3}^{2}-n_{1}^{2}\right] \\
& E_{2}=\frac{1}{2} J_{t} \cdot\left[\frac{2 \pi n_{1}}{60}\right]^{2} \\
& E_{3}=\frac{1}{2} J_{t} \cdot\left[\frac{2 \pi n_{4}}{60}\right]^{2}
\end{aligned}
$$

Units: $E_{i}$ in $W s$ (wattseconds), $J_{t}$ in $\mathrm{kgm}^{2}, \omega$ in rad and $n_{i}$ in $\mathrm{min}^{-1}$.

See the technical data for the energy absorption $\mathrm{E}_{\mathrm{var}}$ of the devices (without consideration of a braking resistor).
In the next calculation steps, only consider those segments $D_{i}$, whose energy $E_{i}$ exceeds the energy absorption of the device. These excess energies $E_{D i}$ must be diverted by means of the braking resistor.
$\mathrm{E}_{\mathrm{Di}}$ is calculated using the following formula:
$E_{D i}=E_{i}-E_{\text {var }}$ (in Ws)
The continuous power $\mathrm{P}_{\mathrm{C}}$ is calculated for each machine cycle:

Units: $P_{C}$ in $W, E_{D i}$ in $W s$ and cycle time $T$ in $s$
The selection is made in two steps:

- If the following conditions are met, the standard braking resistor is sufficient.
- The maximum energy during deceleration must be less than the peak energy that the braking resistor can absorb: $\left(\mathrm{E}_{\mathrm{Di}}\right)<\left(\mathrm{E}_{\mathrm{Cr}}\right)$.
o The continuous power of the standard braking resistor must not be exceeded: $\left(\mathrm{P}_{\mathrm{C}}\right)<\left(\mathrm{P}_{\mathrm{Pr}}\right)$.
- If the conditions are not met, you must use an external braking resistor that meets the conditions.

For order data for the external braking resistors, see chapter Accessories and Spare Parts (see page 475).

## Section 3.5

## Functional Safety

What Is in This Section?
This section contains the following topics:

| Topic | Page |
| :--- | :---: |
| Basics | 70 |
| Definitions | 73 |
| Function | 74 |
| Requirements for Using the Safety Function | 75 |
| Protected Cable Installation for Safety-Related Signals | 77 |
| Application Examples STO | 79 |

## Basics

Automation and safety engineering are closely related. Engineering, installation and operation of complex automation solutions are greatly simplified by integrated safety-related functions and modules.
Usually, the safety engineering requirements depend on the application. The level of the requirements results from, among other things, the risk and the hazard potential arising from the specific application and from the applicable standards and regulations.

The goal of designing machines safely is to protect people. The risk associated with machines with electrically controlled drives comes chiefly from moving machine parts and electricity itself.

Only you, the user, machine builder, or system integrator can be aware of all the conditions and factors realized in the design of your application for the machine. Therefore, only you can determine the automation equipment and the related safeties and interlocks which can be properly used, and validate such usage.

## A WARNING

## NON-CONFORMANCE TO SAFETY FUNCTION REQUIREMENTS

- Specify the requirements and/or measures to be implemented in the risk analysis you perform.
- Verify that your safety-related application complies to applicable safety regulations and standards.
- Make certain that appropriate procedures and measures (according to applicable sector standards) have been established to help avoid hazardous situations when operating the machine.
- Use appropriate safety interlocks where personnel and/or equipment hazards exist.
- Validate the overall safety-related function and thoroughly test the application.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Hazard and Risk Analysis

The standard IEC 61508 "Functional safety of electrical/electronic/programmable electronic safety-related systems" defines the safety-related aspects of systems. Instead of a single functional unit of a safetyrelated system, the standard treats all elements of a function chain as a unit. These elements must meet the requirements of the specific safety integrity level as a whole.
The standard IEC 61800-5-2 "Adjustable speed electrical power drive systems - Safety requirements Functional" is a product standard that defines the safety-related requirements regarding drives. Among other things, this standard defines the safety-related functions for drives.

Based on the system configuration and utilization, a hazard and risk analysis must be carried out for the system (for example, according to EN ISO 12100 or EN ISO 13849-1). The results of this analysis must be considered when designing the machine, and subsequently applying safety-related equipment and safetyrelated functions. The results of your analysis may deviate from any application examples contained in the present or related documentation. For example, additional safety components may be required. In principle, the results from the hazard and risk analysis have priority.

[^1]The EN ISO 13849-1 Safety of machinery - Safety-related parts of control systems - Part 1: General Principles for Design describes an iterative process for the selection and design of safety-related parts of controllers to reduce the risk to the machine to a reasonable degree.
To perform risk assessment and risk minimization according to EN ISO 12100, proceed as follows:

1. Defining the boundary of the machine.
2. Identifying risks associated with the machine.
3. Assessing risks.
4. Evaluating risks.
5. Minimizing risks by:

- Intrinsically safe design
- Protective devices
o User information (see EN ISO 12100)

6. Designing safety-related controller parts (SRP/CS, Safety-Related Parts of the Control System) in an interactive process.
To design the safety-related controller parts in an interactive process, proceed as follows:

| Step | Action |
| :--- | :--- |
| 1 | Identify necessary safety functions that are executed via SRP/CS (Safety-Related Parts of the <br> Control System). |
| 2 | Determine required properties for each safety function. |
| 3 | Determine the required performance level $\mathrm{PL}_{\mathrm{r}}$. |
| 4 | Identify safety-related parts executing the safety function. |
| 5 | Determine the performance level PL of the afore-mentioned safety-related parts. |
| 6 | Verify the performance level PL for the safety function $\left(P L \geq \mathrm{PL}_{\mathrm{r}}\right)$. |
| 7 | Verify if all requirements have been met (validation). |

Additional information is available on www.schneider-electric.com.

Safety Integrity Level (SIL)
The standard IEC 61508 defines 4 safety integrity levels (Safety Integrity Level (SIL)). Safety integrity level SIL1 is the lowest level, safety integrity level SIL4 is the highest level. The safety integrity level required for a given application is determined on the basis of the hazard potential resulting from the hazard and risk analysis. This is used to decide whether the relevant function chain is to be considered as a safety-related function chain and which hazard potential it must cover.

## Average Frequency of a Dangerous Failure per Hour (PFH)

To maintain the function of the safety-related system, the IEC 61508 standard requires various levels of measures for avoiding and controlling faults, depending on the required safety integrity level (Safety Integrity Level (SIL)). All components must be subjected to a probability assessment to evaluate the effectiveness of the measures implemented for controlling faults. This assessment determines the probability of a dangerous failure per hour PFH (Average Frequency of a Dangerous Failure per Hour (PFH)) for a safety-related system. This is the frequency per hour with which a safety-related system fails in a hazardous manner so that it can no longer perform its function correctly. Depending on the SIL, the average frequency of a dangerous failure per hour must not exceed certain values for the entire safetyrelated system. The individual PFH values of a function chain are added. The result must not exceed the maximum value specified in the standard.

| SIL | PFH at high demand or continuous demand |
| :--- | :--- |
| 4 | $\geq 10^{-9} \ldots<10^{-8}$ |
| 3 | $\geq 10^{-8} \ldots<10^{-7}$ |
| 2 | $\geq 10^{-7} \ldots<10^{-6}$ |
| 1 | $\geq 10^{-6} \ldots<10^{-5}$ |

## Hardware Fault Tolerance (HFT) and Safe Failure Fraction (SFF)

Depending on the safety integrity level (Safety Integrity Level (SIL)) for the safety-related system, the IEC 61508 standard requires a specific hardware fault tolerance (Hardware Fault Tolerance (HFT)) in connection with a specific safe failure fraction (Safe Failure Fraction (SFF)). The hardware fault tolerance is the ability of a safety-related system to execute the required function even if one or more hardware faults are present. The safe failure fraction of a safety-related system is defined as the ratio of the rate of safe failures to the total failure rate of the safety-related system. As per IEC 61508, the maximum achievable safety integrity level of a safety-related system is partly determined by the hardware fault tolerance and the safe failure fraction of the safety-related system.

IEC 61800-5-2 distinguishes two types of subsystems (type A subsystem, type B subsystem). These types are specified on the basis of criteria which the standard defines for the safety-related components.

| SFF | HFT type A subsystem |  |  | HFT type $\mathbf{B}$ subsystem |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | $\mathbf{0}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{0}$ | $\mathbf{1}$ | $\mathbf{2}$ |
| $<60 \%$ | SIL1 | SIL2 | SIL3 | --- | SIL1 | SIL2 |
| $60 \ldots<90 \%$ | SIL2 | SIL3 | SIL4 | SIL1 | SIL2 | SIL3 |
| $90 \ldots<99 \%$ | SIL3 | SIL4 | SIL4 | SIL2 | SIL3 | SIL4 |
| $\geq 99 \%$ | SIL3 | SIL4 | SIL4 | SIL3 | SIL4 | SIL4 |

## Fault Avoidance Measures

Systematic errors in the specifications, in the hardware and the software, incorrect usage and maintenance of the safety-related system must be avoided to the maximum degree possible. To meet these requirements, IEC 61508 specifies a number of measures for fault avoidance that must be implemented depending on the required safety integrity level (Safety Integrity Level (SIL)). These measures for fault avoidance must cover the entire life cycle of the safety-related system, i.e. from design to decommissioning of the system.

## Data for Maintenance Plan and the Calculations for Functional Safety

The safety function must be tested at regular intervals. The interval depends on the hazard and risk analysis of the total system. The minimum interval is 1 year (high demand mode as per IEC 61508).

Use the following data of the safety function STO for your maintenance plan and for the calculations for functional safety:

| Lifetime of the safety function STO (IEC 61508) ${ }^{(1)}$ | Years | 20 |
| :---: | :---: | :---: |
| SFF (IEC 61508) <br> Safe Failure Fraction | \% | 90 |
| HFT (IEC 61508) <br> Hardware Fault Tolerance Type A subsystem |  | 1 |
| Safety integrity level <br> IEC 61508 <br> IEC 62061 |  | SIL3 SILCL3 |
| PFH (IEC 61508) <br> Probability of Dangerous Hardware Failure per Hour | $\begin{gathered} \text { 1/h } \\ \text { (FIT) } \end{gathered}$ | $4^{*} 10^{-9}$ <br> (4) |
| PL (ISO 13849-1) Performance Level |  | e (category 3) |
| MTTF $_{\text {d }}$ (ISO 13849-1) <br> Mean Time to Dangerous Failure | Years | 100 (nominal 350) |
| DC (ISO 13849-1) <br> Diagnostic Coverage | \% | 90 |
| (1) See chapter Lifetime Safety Function STO (see page 490). |  |  |

Contact your local Schneider Electric representative for additional data, if required.

## Definitions

Integrated Safety Function "Safe Torque Off" STO
The integrated safety function STO (IEC 61800-5-2) allows for a category 0 stop as per IEC 60204-1 without external power contactors. It is not necessary to interrupt the supply voltage for a category 0 stop. This reduces the system costs and the response times.

Category 0 Stop (IEC 60204-1)
In stop category 0 (Safe Torque Off, STO), the drive coasts to a stop (provided there are no external forces operating to the contrary). The STO safety-related function is intended to help prevent an unintended startup, not stop a motor, and therefore corresponds to an unassisted stop in accordance with IEC 60204-1.
In circumstances where external influences are present, the coast down time depends on physical properties of the components used (such as weight, torque, friction, etc.), and additional measures such as mechanical brakes may be necessary to help prevent any hazard from materializing. That is to say, if this means a hazard to your personnel or equipment, you must take appropriate measures.

## A WARNING

## UNINTENDED EQUIPMENT OPERATION

- Make certain that no hazards can arise for persons or material during the coast down period of the axis/machine
- Do not enter the zone of operation during the coast down period.
- Ensure that no other persons can access the zone of operation during the coast down period.
- Use appropriate safety interlocks where personnel and/or equipment hazards exist.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Category 1 Stop (IEC 60204-1)

For stops of category 1 (Safe Stop 1, SS1), you can initiate a controlled stop via the control system, or through the use of specific functional safety-related devices. A Category 1 Stop is a controlled stop with power available to the machine actuators to achieve the stop.
The controlled stop by the control/safety-related system is not safety-relevant, nor monitored, and does not perform as defined in the case of a power outage or if an error is detected. This has to be implemented by means of an external safety-related switching device with safety-related delay.

## Function

The safety function STO integrated into the product can be used to implement an "EMERGENCY STOP" (IEC 60204-1) for category 0 stops. With an additional, approved EMERGENCY STOP safety relay module, it is also possible to implement category 1 stops.

## Function Principle

The safety function STO is triggered via two redundant signal inputs. The wiring of the two signal inputs must be separate.

The safety function STO is triggered if the level at one of the two signal inputs is 0 . The power stage is disabled. The motor can no longer generate torque and coasts down without braking. An error of error class 3 is detected.

If, within one second, the level of the other output also becomes 0 , the error class remains 3 . If, within one second, the level of the other output does not become 0 , the error class changes to 4 .

## Requirements for Using the Safety Function

The safety function STO (Safe Torque Off) does not remove power from the DC bus. The safety function STO only removes power to the motor. The DC bus voltage and the mains voltage to the drive are still present.

## A. 1 DANGER

## ELECTRIC SHOCK

- Do not use the safety function STO for any other purposes than its intended function.
- Use an appropriate switch, that is not part of the circuit of the safety function STO, to disconnect the drive from the mains power.

Failure to follow these instructions will result in death or serious injury.

After the safety function STO is triggered, the motor can no longer generate torque and coasts down without braking.

| WNARNING |
| :--- | :--- |
| UNINTENDED EQUIPMENT OPERATION |
| Install a dedicated service brake if coasting does not meet the deceleration requirements of your |
| application. |

## Logic Type

The inputs for the safety function STO (inputs STO_A and STO_B) can only be wired for positive logic.

## Holding Brake and Safety Function STO

When the safety function STO is triggered, the power stage is immediately disabled. Applying the holding brake requires a certain amount of time. In the case of vertical axes or external forces acting on the load, you may have to take additional measures to bring the load to a standstill and to keep it at a standstill when the safety function STO is used, for example, by using a service brake.

| WNARNING |
| :--- | :--- |
| FALLING LOAD |
| Ensure that all loads come to a secure standstill when the safety function STO is used. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

If the suspension of hanging / pulling loads is a safety objective for the machine, then you can only achieve this objective by using an appropriate external brake as a safety-related measure.

| UNARNING |
| :--- | :--- |
| UNINTENDED AXIS MOVEMENT |
| - Do not use the internal holding brake as a safety-related measure. |
| - Only use certified external brakes as safety-related measures. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

NOTE: The drive does not provide its own safety-related output to connect an external brake to use as a safety-related measure.

## Unintended Restart

To help avoid unintended restart of the motor after restoration of power (for example, after power outage), the parameter IO_AutoEnable must be set to "off".
Also verify that a master controller will not trigger an unintended restart.

| WNARNING |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| Set parameter IO_AutoEnable to "off" if the automatic enabling of the power stage presents hazards |
| in your application. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

Degree of Protection when the Safety Function is Used
You must ensure that conductive substances cannot get into the product (pollution degree 2). Conductive substances may cause the safety function to become inoperative.

| INOPERABLE SAFETY FUNCTION |
| :--- |
| INARNING |
| Ensure that conductive substances (water, contaminated or impregnated oils, metal shavings, etc.) |
| cannot get into the drive. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

## Protected Cable Installation

If short circuits and other wiring errors such as a cross fault between the signals of the safety function STO can be expected in connection with safety-related signals, and if these short circuits and cross faults are not detected by upstream devices, protected cable installation as per ISO 13849-2 is required.
In the case of an unprotected cable installation, the two signals (both channels) of a safety function may be connected to external voltage if a cable is damaged. If the two channels are connected to external voltage, the safety function is no longer operative.

## Protected Cable Installation for Safety-Related Signals

ISO 13849-2 describes protected cable installation for cables for safety-related signals. The cables for the safety function STO must be protected against external voltage. A shield with ground connection helps to keep external voltage away from the cables for the signals of the safety function STO.

Ground loops can cause problems in machines. A shield connected at one end only is sufficient for grounding and does not create a ground loop.

- Use shielded cables for the signals of the safety function STO.
- Do not use the cable for the signals of the safety function STO for other signals.
- Connect one end of the shield.
- When daisychaining the signals of the safety function STO, use the shield connection at STO IN.

Example of protected cable installation for safety-related signals

Notes on the Connection Modules
The connection modules are designed for connection of one end of the shield.
Example of connection of one end of shield at the I/O module with industrial connectors

| $\quad$ WARNING |
| :--- | :--- |
| UNINTENDED EQUIPMENT OPERATION |
| Do not connect any wiring to reserved, unused connections, or to connections designated as No |
| Connection (N.C.). |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

Example of connection of one end of shield at the I/O module with spring terminals

Accessories: Cables and Connectors for I/O Module with Industrial Connectors
The accessories are designed for connection of one end of the shield. One end of the cables for the safety function STO is pre-assembled. The pre-assembled connector of the cables for the safety function STO is connected to STO IN. The connector for the safety function STO VW3L50010 is not connected to the shield; it is connected to STO OUT. One end of the shield of the pre-assembled cables VW3M94C is connected.
Using pre-assembled cables helps to reduce the possibility of wiring errors. See chapter Accessories and Spare Parts (see page 475).

## Application Examples STO

## Example of Category 0 stop

Use without EMERGENCY STOP safety relay module, category 0 stop.
Example of category 0 stop

In this example, when an EMERGENCY STOP is activated, it leads to a category 0 stop.
The safety function STO is triggered via a simultaneous 0-level at both inputs (time offset of less than 1 s ). The power stage is disabled and an error of error class 3 is detected. The motor can no longer generate torque.
If the motor is not already at a standstill when the STO is triggered, it decelerates under the salient physical forces (gravity, friction, etc.) active at the time until presumably coasting to a standstill.

| UNINTENDED EQUIPMENT OPERATION |
| :--- |
| UNARNING |
| Install a dedicated service brake if coasting does not meet the deceleration requirements of your |
| application. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

If the coasting of the motor and its potential load is unsatisfactory as determined by your risk and hazard analysis, an external brake may also be required. See Holding Brake and Safety Function STO (see page 75 ).

Use with EMERGENCY STOP safety relay module, category 1 stop.
Example of category 1 stop with external Preventa XPS-AV EMERGENCY STOP safety relay module

In this example, when an EMERGENCY STOP is activated, it leads to a category 1 stop.
The EMERGENCY STOP safety relay module requests an immediate stop (undelayed) of the drive, for example by means of the function "Halt". After the time delay set in the EMERGENCY STOP safety relay module has elapsed, the EMERGENCY STOP safety relay triggers the safety function STO.

The safety function STO is triggered via a simultaneous 0 -level at both inputs (time offset of less than 1 s ). The power stage is disabled and an error of error class 3 is detected. The motor can no longer generate torque.
If the coasting of the motor and its potential load is unsatisfactory as determined by your risk and hazard analysis, an external brake may also be required. See Holding Brake and Safety Function STO (see page 75).

| WNARNING |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| Install a dedicated service brake if coasting does not meet the deceleration requirements of your |
| application. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

## Section 3.6

PROFINET Fieldbus

What Is in This Section?
This section contains the following topics:

| Topic | Page |
| :--- | :---: |
| Conformance Classes | 82 |
| Network Topology | 83 |
| Data Structure | 84 |
| Cyclic Communication - Overview | 85 |
| Cyclic Communication - Structure of the Output Data | 86 |
| Cyclic Communication - Structure of the Input Data | 87 |
| Cyclic Communication - Parameter Channel | 89 |
| Cyclic Communication - Handshake via the "Mode Toggle" Bit | 91 |
| Acyclic Communication - Overview | 92 |
| Acyclic Communication - Example: Reading a Parameter (with Configuration Tool STEP 7) | 93 |

## Conformance Classes

PROFINET is a communication protocol based on Industrial Ethernet.
Depending on the application area, PROFINET functionality is subdivided into 3 classes:

- Conformance class A (CC-A)
- Conformance class B (CC-B)
- Conformance class C (CC-C)

## Conformance Class A (CC-A)

Conformance class A provides basic functions for cyclic real-time communication and acyclic TCP/IP communication. Typical applications include building automation.

## Conformance Class B (CC-B)

Conformance class $B$ adds network diagnostics, SNMP and topology information to conformance class A. Typical applications include process automation.

Conformance Class C (CC-C)
Conformance class C adds bandwidth reservation and synchronization to conformance class B. Typical applications include positioning systems.

Supported Conformance Class
The device supports conformance class B (CC-B).

## Network Topology

A PROFINET network consists of the following components:

- PROFINET IO supervisor (corresponds to the definition of a PROFIBUS master class 2)
- One or several PROFINET IO controllers (corresponds to the definition of a PROFIBUS master class 1)
- One or several PROFINET IO devices (corresponds to the definition of a PROFIBUS slave)
The PROFINET network uses CAT5e Ethernet cable.

IO Supervisor
The IO supervisor allows for commissioning and network diagnostics. Examples of IO supervisors:

- PCs
- HMIs
- Programming devices

IO Controller
The IO controller sends the output data to the IO device and receives the input data from the IO device.
Examples of IO controllers:

- Automation devices, for example, logic controllers

IO Devices
The IO device receives commands form the IO controller and sends status information to the IO controller. Examples of IO devices:

- Input/output modules
- Drive systems
- Sensors and actuators

## Data Structure

Overview
Byte, word and double word values are shown in hexadecimal notation. Hexadecimal values are indicated as such by means of an " $h$ " behind the numerical value, for example, " 31 h ". Decimal values have no special identification. Note the different counting format of bits (right to left) and bytes (left to right).
General data structure from bit to double word

1 Word
= 2 Byte

Used Byte Sequence: Big Endian Format
The bytes are transmitted in Big Endian format.

## Cyclic Communication - Overview

PROFINET provides functionality for cyclic communication, station-specific, module-specific and channelspecific diagnostics, as well as various alarm types for diagnostics.

## Input Data and Output Data

With the output data, the IO controller sends a command to the IO device, for example, in order to start an operating mode, trigger a function, perform a movement or request status information. The IO device executes the command and acknowledges it with a confirmation.

The exchange of data follows a fixed pattern:

- Output data to the IO device: The IO controller places a command in the output data memory. From there, it is transmitted to the IO device and executed.
- Input data from IO device: The IO device acknowledges the command in the input data. If the command was successfully executed, the IO controller receives an acknowledgement without an error message.
The IO controller cannot send a new command unless it has received acknowledgement concerning the ongoing command. Acknowledgement information and error messages are included in the transmitted data in bit-coded form.

The IO controller receives up-to-date input data from the IO device during each cycle. The input data contains acknowledgement information concerning a transmitted command and status information.

The data of the cyclic communication comprise 2 parts:

- Process data channel
- Parameter channel (optional)

The selection of the drive profile determines whether or not the parameter channel is to be used.

## Process Data Channe

The process data channel is used for realtime data exchange, for example the actual position or the actual velocity. Transmission is fast because the data is sent without additional administration data and data transmission acknowledgement from the recipient is not required.

The IO controller can control the operating states of the IO device via the process data channel, for example:

- Enabling and disabling the power stage
- Starting and terminating operating modes
- Starting and terminating movements
- Triggering a "Quick Stop" / resetting a "Quick Stop"
- Resetting an error message

Changing operating states and activating operating modes must be done separately. An operating mode can only be started if the operating state of the drive is 6 Operation Enabled.

Parameter Channel
The IO controller can request a parameter value from the IO device or change a parameter value via the parameter channel. Each parameter can be uniquely addressed via the index and subindex.

Drive Profile
The product supports the following drive profiles:

- Profile 104: "Drive Profile Lexium 1" (vendor-specific)
- Profile 105: "Drive Profile Lexium 2" (vendor-specific)

| Profile 104 "Drive Profile Lexium 1" | Profil 105: "Drive Profile Lexium 2" |
| :--- | :--- |
| Profile with 26 bytes | Profile with 10 bytes |
| Advanced functionality | Core functionality |
| With parameter channel (8 bytes) | Without parameter channel |

## Cyclic Communication - Structure of the Output Data

Overview
The output data is used to transmit requests from the IO controller to the IO device.
Output data "Drive Profile Lexium 1", profile 104

Output data "Drive Profile Lexium 2", profile 105
(2)

1 Parameter channel
2 Process data channel

Parameter Channel "ParCh"
Parameters can be read or written via "ParCh", see chapter Cyclic Communication - Parameter Channel (see page 89).

Word "dmControl"
The word "dmControl" is used to set the operating state and the operating mode.
See chapters Changing the Operating State via Fieldbus (see page 246) and Starting and Changing an Operating Mode (see page 249) for a detailed description of the bits.

## Double Words "RefA32" and "RefB32"

The two double words "RefA32" and "RefB32" are used to set two values for the operating mode. The meaning depends on the operating mode; it is described in the chapters on the individual operating modes.

Double Words "ACC" and "DEC"
The two double words "ACC" and "DEC" are used to set the values for the acceleration ramp and the deceleration ramp. The acceleration ramp corresponds to the parameter RAMP v acc, the deceleration ramp corresponds to the parameter RAMP_v_dec.

## Bytes "Optional Data"

"Optional Data" is used to append additional parameters to the profile that can be selected by the user (mapping). See chapter Settings with the Configuration Tool STEP7 - V13 (TIA Portal) (see page 148) for additional information on mapping.

## Cyclic Communication - Structure of the Input Data

## Overview

The input data is used to transmit information from the IO device to the IO controller. Input data "Drive Profile Lexium 1", profile 104
(1)
(2)

Input data "Drive Profile Lexium 2", profile 105
(2)

1 Parameter channel
2 Process data channel

## Parameter Channel "ParCh"

Parameters can be read or written via "ParCh", see chapter Cyclic Communication - Parameter Channel (see page 89).

Word "driveStat"
The current operating state is indicated with the "driveStat" word.
For a detailed description of the bits, see chapter Indication of the Operating State via Fieldbus (see page 243).

Word "mfStat"
The word "mfStat" is used to indicate the current operating mode.
For a detailed description of the bits, see chapter Indicating an Operating Mode (see page 248).

## Word "motionStat"

The word "motionStat" is used to provide information on the motor and profile generator.

| Bit | Meaning |
| :--- | :--- |
| 1 | Positive limit switch triggered |
| 2 | Negative limit switch triggered |
| $3 \ldots 5$ | Reserved |
| 6 | MOTZ: Motor at a standstill |
| 7 | MOTP: Motor movement in positive direction |
| 8 | MOTN: Motor movement in negative direction |
| 9 | Setting via parameter DS402intLim |

| Bit | Meaning |
| :--- | :--- |
| 10 | Setting via parameter DPL_intLim |
| 11 | TAR0: Profile generator at standstill |
| 12 | DEC: Profile generator decelerates |
| 13 | ACC: Profile generator accelerates |
| 14 | CNST: Profile generator moves at constant velocity |
| 15 | Reserved |

Word "drivelnput"
The word "drivelnput" is used to indicate the status of the digital signal inputs.

| Bit | Signal | Factory setting |
| :--- | :--- | :--- |
| 0 | DI0 | Signal input function Freely Available |
| 1 | DI1 | Signal input function Reference Switch (REF) |
| 2 | DI2 | Signal input function Positive Limit Switch (LIMP) |
| 3 | DI3 | Signal input function Negative Limit Switch (LIMN) |
| $4 \ldots 15$ | - | Reserved |

Double Word "_p_act"
The double word "_p_act" indicates the actual position. The value corresponds to the parameter _p_act.

Double Word "_v_act"
The double word "_v_act" can be parameterized. You can select the parameter _v_act (actual velocity) or the parameter _n_act (actual speed of rotation), see chapter Mapping for "_v_act" (see page 149).

Word "_I_act"
The word "_I_act" is used to provide information on the total motor current. The value corresponds to the parameter_I_act.

Word "ModeError"
The word "ModeError" is used to provide the vendor-specific error code that caused the ModeError to be set. The ModeError bit relates to MT-dependent parameters. The value corresponds to the parameter _ModeError.

## Bytes "Optional Data"

"Optional Data" is used to append additional parameters to the profile that can be selected by the user (mapping). See chapter Settings with the Configuration Tool STEP7 - V13 (TIA Portal) (see page 148) for additional information on mapping.

## Cyclic Communication - Parameter Channel

## Overview

The IO controller can request a parameter value from the IO device or change a parameter value via the parameter channel. Each parameter can be uniquely addressed via the index and subindex.

Byte "Ctrl"
Byte "Ctrl" contains the request to read or write a parameter.
The output data contains the information whether a parameter is to be read or written. The input data contains the information whether the read request or the write request were successful.
Output data:

| Ctrl | Function |
| :--- | :--- |
| $00_{h}$ | No request |
| $10_{\mathrm{h}}$ | Read request |
| $20_{\mathrm{h}}$ | Write request (word) |
| $30_{\mathrm{h}}$ | Write request (double word) |

Input data:

| Ctrl | Function |
| :--- | :--- |
| $00_{\mathrm{h}}$ | Request not yet completed |
| $10_{\mathrm{h}}$ | Read request or write request successfully completed (word) |
| $20_{\mathrm{h}}$ | Read request or write request successfully completed <br> (double word) |
| $70_{\mathrm{h}}$ | Error message |

Only one request can be processed at a time. The IO device provides the response until the IO controller sends a new request. If a response includes parameter values, the IO device responds with the current value in the case of a repetition.

Read requests are only executed by the IO device if the value changes from $00_{h}$ to $10_{h}$. Write requests requests are only executed by the IO device if the value changes from $00_{h}$ to $20_{h}$ or to $30_{h}$.

## Byte "Subindex"

The byte "Subindex" must be set to the value $00_{h}$.

## Word "Index"

The word "Index" contains the parameter address.

The double word "PV" contains the parameter value.
In the case of a read request, the value in the output data has no significance. The input data contains the parameter value.

In the case of a write request, the output data contains the value to be written to the parameter. The input data contains the parameter value.

If a read request or a write request were not successful, the double word "PV" contains the error number of the error.

## Example: Reading a Parameter

In the example, the program number of the product is read from the parameter _prgNoDEV. The parameter _prgNoDEV has the parameter address 258 ( $01_{\text {h }} 02_{h}$ ).

The parameter value read has the decimal value 91200 which corresponds to $01_{h} 64_{h} 40_{h}$.
Output data:

| Ctrl | Subindex | Index | PV |
| :--- | :--- | :--- | :--- |
| $10_{h}$ | $00_{h}$ | $01_{h} 02_{h}$ | $00_{h} 00_{h} 00_{h} 00_{h}$ |

Input data:

| Ctrl | Subindex | Index | PV |
| :--- | :--- | :--- | :--- |
| $20_{h}$ | $00_{h}$ | $01_{h} 02_{h}$ | $00_{h} 01_{h} 64_{h} 40_{h}$ |

Example: Writing of an Invalid Parameter
In this example, the value of a non-existent parameter is to be changed. The parameter has the parameter address $101\left(00_{h} 65_{h}\right)$. The value of the parameters is to be changed to $222\left(D E_{h}\right)$.

Before the IO device can accept a new request, the value $00_{h}$ must first be transmitted in byte "Ctrl".
Since the IO device cannot address the parameter, a synchronous error message is transmitted with the input data. Byte "Ctrl" is set to $70_{h}$. Double word "PV" is set to the error number (error number $1101_{h}$ : Parameter does not exist).
Output data:

| Ctrl | Subindex | Index | PV |
| :--- | :--- | :--- | :--- |
| $30_{h}$ | $00_{h}$ | $00_{h} 65_{h}$ | $00_{h} 00_{h} 00_{h} D E_{h}$ |

Input data:

| Ctrl | Subindex | Index | PV |
| :--- | :--- | :--- | :--- |
| $70_{h}$ | $00_{h}$ | $00_{h} 65_{h}$ | $00_{h} 00_{h} 11_{h} 01_{h}$ |

## Cyclic Communication - Handshake via the "Mode Toggle" Bit

## Mode Toggle

The "Drive Profile Lexium" uses synchronous communication. In the case of synchronous communication, the IO controller waits for a response from the IO device prior to new actions.
Synchronous communication is controlled by means of the appropriate bits in the output data and the input data:

- Output data: In the word "dmControl" by means of the bit "Mode Toggle"
- Input data: In the byte "mfStat" by means of the bit "ModeError" and the bit "Mode Toggle"

The bit "Mode Toggle" is effective with a rising edge and a falling edge.

## Example 1: Positioning

The IO controller starts a movement at point in time $t_{0}$. At points in time $t_{1}, t_{2} \ldots$, the $I O$ controller verifies the responses from the IO device. It waits for the end of the movement. The end of the movement is detected when bit "x_end" $=1$.

1 Output data
2 Input data
3 IO controller starts movement: Bit "Mode Toggle" = 1 .
$41 O$ device reports "Movement running": Bit "Mode Toggle" $=1$, bit "x_end" $=0$.
5 IO device reports "Movement terminated": Bit "x_end" = 1 .

## Example 2: Short-Distance Movement

The IO controller starts a short-distance movement at point in time $t_{0}$. The duration is shorter than the request cycle of the IO controller. At point in time $t_{1}$ the movement is terminated. Bit "x_end" does not allow the IO controller to detect whether the movement is already terminated or has not yet been started. However, it can identify the current state with the "Mode Toggle" bit.

1 Output data
Input data
IO controller starts movement: Bit "Mode Toggle" = 1 .
4 IO device reports "Movement running": Bit "Mode Toggle" = 1 and bit "x_end" $=0$.
5 IO device reports "Movement terminated": Bit "x_end" = 1 .

## Acyclic Communication - Overview

Overview
In addition to cyclic communication, the IO controller and the IO device can also communicate acyclically.
Acyclic communication enables the change of parameters during operation, but it is slower than the cyclic communication. Additionally, an acyclic communication is used for error messages via "Diagnostics Alarm" (see page 363).

Acyclic Communication - Parameter Channel
The IO device supports acyclic data exchange with an IO controller and an IO supervisor.
Structure of acyclic communication:

- IO controller sends WRITE Request with data (read parameter or write parameter).
- IO device confirms write request with WRITE Response.
- IO controller sends READ Request.
- IO device confirms read request with READ Response. Depending on the request, several READ Request / READ Response cycles without data transmission may be required before the IO device can provide the data with a READ Response.

Acyclic Communication: Elements
The following items are defined for acyclic communication:

|  | Data type | Value |
| :---: | :---: | :---: |
| REQUEST REFERENCE | Unsigned 8 | $00_{\mathrm{h}}$ : Reserved $01_{\mathrm{h}} \ldots \mathrm{FF}_{\mathrm{h}}$ |
| REQUEST ID | Unsigned 8 | $01_{\mathrm{h}}$ : Request Parameter 02h: Change Parameter |
| RESPONSE ID | Unsigned 8 | Response (+) $00_{\mathrm{h}}$ : Reserved <br> 01 h : Request Parameter (+) <br> 02h: Change Parameter (+) <br> Response (-) <br> 81 h : Request Parameter (-) <br> 82 : Change Parameter (-) |
| AXIS | Unsigned 8 | 01 ${ }_{\text {h }}$ |
| NO. OF PARAMETERS | Unsigned 8 | 01 h ...17 $1_{\mathrm{h}}: 1 . .23$ DWORD (240 data bytes) |
| ATTRIBUTE | Unsigned 8 | $00_{h}$ : Reserved <br> 01 h : Value |
| NO. OF ELEMENTS | Unsigned 8 | $00_{h}$ : Special Function 01h $\ldots$ EA $_{h}$ : Quantity 1 ... 234 |
| PARAMETER NUMBER | Unsigned 16 | $00_{h}$ : Reserved <br> $0001_{\mathrm{h}} \ldots$ FFFF $_{\mathrm{h}}$ : Parameter Index |
| SUBINDEX | Unsigned 16 | $000 \mathrm{O}_{\mathrm{h}}$ (Drive Profile Lexium) |
| FORMAT | Unsigned 8 | 42 h : WORD $43_{h}$ : DWORD 44 h : ERROR |
| NO. OF VALUES | Unsigned 8 | 00 ${ }_{\text {h }} \ldots$ EA $A_{\text {h }}$ : Quantity $0 \ldots 234$ |
| ERROR NUMBER | Unsigned 16 | $0^{0000}{ }_{\text {h }} \ldots .0064_{\text {h }}$ Error codes |

## Acyclic Communication - Example: Reading a Parameter (with Configuration Tool STEP 7)

Sending WRITE Request
Administration data:

| WRITE Request |  | Description |
| :--- | :--- | :--- |
| Index | 47 | Index (Drive Profile Lexium: 47) |
| Length | 10 | 10 bytes payload |

Payload data:

| Byte | Name | Value | Description |
| :--- | :--- | :--- | :--- |
| 0 | REQUEST REFERENCE | $01_{h}$ | Reference number for parameter request |
| 1 | REQUEST ID | $01_{h}$ | Request Parameter |
| 2 | AXIS | $01_{h}$ | Axis 1 |
| 3 | NO. OF PARAMETERS | $01_{h}$ | 1 parameter is transmitted |
| 4 | ATTRIBUTE | $10_{h}$ | Parameter value (access) |
| 5 | NO. OF ELEMENTS | $00_{h}$ | Access to direct value (>0: sub-elements) |
| 6,7 | PARAMETER NUMBER | $0104_{h}$ | Firmware version (1.2) |
| 8,9 | SUBINDEX | $0000_{h}$ | Subindex: In drive profile Lexium 0 |

Sending READ Request
Administration data:

| READ Request |  | Description |
| :--- | :--- | :--- |
| Index | 47 | Index (Drive Profile Lexium: 47) |
| Length | 10 | 10 bytes receive buffer |

Receiving READ Response
Administration data:

| READ Response | Description |  |
| :--- | :--- | :--- |
| Index | 47 | Index (Drive Profile Lexium: 47) |
| Length | 8 | 8 bytes payload |

Payload data:

| Byte | Name | Value | Description |
| :--- | :--- | :--- | :--- |
| 0 | RESPONSE REFERENCE | $01_{\mathrm{h}}$ | Mirrored reference number of parameter request |
| 1 | RESPONSE ID | $01_{\mathrm{h}}$ | Positive response for requested parameter |
| 2 | AXIS | $01_{\mathrm{h}}$ | Mirrored axis number (axis 1) |
| 3 | NO. OF PARAMETERS | $01_{\mathrm{h}}$ | 1 parameter is transmitted. |
| 4 | FORMAT | $42_{\mathrm{h}}$ | Parameter format (WORD) |
| 5 | NO. OF VALUES | $01_{\mathrm{h}}$ | Access to 1 value |
| 6,7 | VALUE | $\mathrm{xxxx}_{\mathrm{h}}$ | Value of the parameter |

## Chapter 4

## Installation

What Is in This Chapter?
This chapter contains the following sections:

| Section | Topic | Page |
| :--- | :--- | :---: |
| 4.1 | Mechanical Installation | 96 |
| 4.2 | Electrical Installation | 101 |
| 4.3 | I/O Module with Industrial Connectors | 113 |
| 4.4 | I/O Module with Spring Terminals | 121 |
| 4.5 | Verifying Installation | 134 |

## Section 4.1

## Mechanical Installation

What Is in This Section?
This section contains the following topics:

| Topic | Page |
| :--- | :---: |
| Before Mounting | 97 |
| Mounting the Motor | 98 |

## Before Mounting

## Inspecting the Product

- Verify the product version by means of the type code. See chapter Type Code (see page 19).
- Prior to mounting, inspect the product for visible damage.

Damaged products may cause electric shock or unintended equipment operation.

## A 1 DANGER

## ELECTRIC SHOCK OR UNINTENDED EQUIPMENT OPERATION

- Do not use damaged products.
- Keep foreign objects (such as chips, screws or wire clippings) from getting into the product.

Failure to follow these instructions will result in death or serious injury.

Contact your local Schneider Electric representative if you detect any damage whatsoever to the products.

Inspecting the Holding Brake (Option)
See chapter Inspecting/Breaking In the Holding Brake (see page 489).

## Cleaning the Shaft

The shaft extensions are factory-treated with an anti-corrosive. If output components are glued to the shaft, the anti-corrosive must be removed and the shaft cleaned. If required, use a grease removal agent as specified by the glue manufacturer. If the glue manufacturer does not provide information on grease removal, acetone may be used.

- Remove the anti-corrosive. Avoid direct contact of the skin and the sealing parts with the anti-corrosive or the cleaning agent.

## Mounting Surface for Flange

The mounting surface must be stable, clean, deburred and low-vibration. Ensure that the mounting surface is itself grounded, and that a potential exists between the motor flange and the mounting surface.

### 4.1 DANGER

## ELECTRIC SHOCK CAUSED BY INSUFFICIENT GROUNDING

- Verify compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of the entire drive system.
- Ground the drive system before applying voltage.
- Do not use conduits as protective ground conductors; use a protective ground conductor inside the conduit.
- The cross section of the protective ground conductor must comply with the applicable standards.
- Do not consider cable shields to be protective ground conductors.

Failure to follow these instructions will result in death or serious injury.

- Verify that the mounting surface meets all requirements in terms of dimensions and tolerances. See chapter Dimensions (see page 24).

### 4.4 DANGER

## ELECTRIC SHOCK OR UNINTENDED EQUIPMENT OPERATION

- Keep foreign objects from getting into the product.
- Verify the correct seating of seals and cable entries in order to avoid contamination such as deposits and humidity.
Failure to follow these instructions will result in death or serious injury.

Motors can generate strong local electrical and magnetic fields. This can cause interference in sensitive devices.

| EWARNING |
| :--- | :--- |
| ELECTROMAGNETIC FIELDS |
| - Keep persons with electronic medical implants, such as pacemakers, away from the motor. |
| - Do not place electromagnetically sensitive devices in the vicinity of the motor. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

The metal surfaces of the product may exceed $70^{\circ} \mathrm{C}\left(158^{\circ} \mathrm{F}\right)$ during operation.

|  | H CAUTION |
| :--- | :--- |
| HOT SURFACES |  |
| - Avoid unprotected contact with hot surfaces. |  |
| - Do not allow flammable or heat-sensitive parts in the immediate vicinity of hot surfaces. |  |
| - Verify that the heat dissipation is sufficient by performing a test run under maximum load conditions. |  |
| Failure to follow these instructions can result in injury or equipment damage. |  |

## A CAUTION <br> IMPROPER APPLICATION OF FORCES <br> - Do not use the motor as a step to climb into or onto the machine. <br> - Do not use the motor as a load-bearing part. <br> - Use hazard labels and guards on your machine to help prevent the improper application of forces on the motor. <br> Failure to follow these instructions can result in injury or equipment damage.

Electrostatic discharge to the shaft may cause incorrect operation of the encoder system and result in unanticipated motor movements and damage to the bearing.

| A WARNING |
| :--- |
| UNINTENDED MOVEMENT CAUSED BY ELECTROSTATIC DISCHARGE |
| Use conductive components such as antistatic belts or other suitable measures to avoid static charge by |
| motion. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

If the permissible ambient conditions are not respected, external substances from the environment may penetrate the product and cause unintended movement or equipment damage.

| UNINTENDED MOVEMENT |
| :--- |
| - Verify that the allowable ambient conditions specified in the present document and in the |
| documentation of any supporting hardware or accessories are respected. |
| - Do not allow seals to run dry. |
| - Keep liquids from getting to the shaft bushing (for example, in mounting position IM V3). |
| - Do not expose the shaft sealing rings and cable entries of the motor to the direct spray of a pressure |
| washer. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

Motors are very heavy relative to their size. The great mass of the motor can cause injuries and damage.

| HEAVY AND/OR FALLING PARTS |
| :--- |
| - Use a suitable crane or other suitable lifting gear for mounting the motor if required by the weight of |
| the motor. |
| - Use the necessary personal protective equipment (for example, protective shoes, protective glasses |
| and protective gloves). |
| - Mount the motor so that it cannot come loose (use of securing screws with appropriate tightening |
| torque), especially in cases of fast acceleration or continuous vibration. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

## Mounting Distances, Ventilation

When selecting the position of the device, note the following:

- No minimum distances are required for installation. However, free convection must be possible.
- Avoid heat accumulations.
- Do not obstruct the ventilation slots; keep dirt from reaching the ventilation slots.
- Do not mount the device close to heat sources. Mutual heating of several devices leads to derating.
- Do not mount the device on flammable materials.
- The heated airflow from other devices and components must not heat up the air used for cooling the device.
- If the thermal limits are exceeded during operation, the power stage of the drive is disabled (overtemperature).

## Convection Channels

The convection channels featured by size 100 increase the heat dissipation. Do not obstruct the convection channels so that there is no derating.

Mounting Position
The following mounting positions are defined and approved as per IEC 60034-7:

IM B5

IM V1

IM V3

Mounting
When the motor is mounted to the mounting surface, it must be accurately aligned axially and radially and make even contact with the mounting surface. All mounting screws must be tightened with the specified tightening torque. No uneven mechanical load must be applied when the mounting screws are tightened. See chapter Technical Data (see page 21) for data, dimensions and degrees of protection (IP).

## Mounting Output Components

Output components such as pulleys and couplings must be mounted with suitable equipment and tools. Motor and output component must be accurately aligned both axially and radially. If the motor and the output component are not accurately aligned, this will cause runout and premature wear.

The maximum axial and radial forces acting on the shaft must not exceed the maximum shaft load values specified, see chapter Shaft-Specific Data (see page 30).

## Section 4.2

## Electrical Installation

## What Is in This Section?

This section contains the following topics:

| Topic | Page |
| :--- | :---: |
| General | 102 |
| Ground Connection | 103 |
| Mounting LXM32i | 104 |
| Standard Braking Resistor | 105 |
| External Braking Resistor (Accessories) | 106 |
| Mains Supply | 108 |
| Commissioning Interface | 111 |
| Mounting the I/O Connection Module | 112 |

## A 1 DANGER

## ELECTRIC SHOCK OR UNINTENDED EQUIPMENT OPERATION

- Keep foreign objects from getting into the product.
- Verify the correct seating of seals and cable entries in order to avoid contamination such as deposits and humidity.
Failure to follow these instructions will result in death or serious injury.

Opening the side wall exposes hazardous voltages and damages the insulation.

## A. 1 DANGER

## ELECTRIC SHOCK

Do not open the side wall.
Failure to follow these instructions will result in death or serious injury.

The +24 VDC supply voltage is connected with many exposed signal connections in the drive system.

## A. 1 DANGER

## ELECTRIC SHOCK CAUSED BY INCORRECT POWER SUPPLY UNIT

- Use a power supply unit that meets the PELV (Protective Extra Low Voltage) requirements.
- Connect the negative output of the power supply unit to PE (ground).

Failure to follow these instructions will result in death or serious injury.

## Ground Connection

This product has a leakage current greater than 3.5 mA . If the protective ground connection is interrupted, a hazardous touch current may flow if the housing is touched.

## 4 A DANGER

## INSUFFICIENT GROUNDING

- Use a protective ground conductor with at least $10 \mathrm{~mm}^{2}$ (AWG 6) or two protective ground conductors with the cross section of the conductors supplying the power terminals.
- Verify compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of all equipment.
- Ground the drive system before applying voltage.
- Do not use conduits as protective ground conductors; use a protective ground conductor inside the conduit.
- Do not use cable shields as protective ground conductors.

Failure to follow these instructions will result in death or serious injury.

## Connecting to Ground

The ground connection is located at the top of the motor flange.

- Connect the ground connection to the central grounding point of the system.

| Tightening torque grounding screw M4 | Nm (lb•in) | $2.9(25.7)$ |
| :--- | :--- | :--- |
| Property class of grounding screw | H | 8.8 |

Electrostatic discharge (ESD) may permanently damage the module either immediately or over time.

## NOTICE

## EQUIPMENT DAMAGE DUE TO ESD

- Use suitable ESD measures (for example, ESD gloves) when handling the module.
- Do not touch internal components.

Failure to follow these instructions can result in equipment damage.

- Remove the transport lock.
- Check the seals for damage. You must not use devices with damaged seals.
- (1) Plug the LXM32i onto the BMi.
- (2) The catch must snap in properly.
- (3) Fasten the LXM32i by tightening the fastening screw.

Note the specified tightening torque see chapter Tightening Torque and Screws (see page 42).

## Standard Braking Resistor

The standard braking resistor is factory-mounted in slot 2; it can be used in slot 2 or in slot 1.
If the standard braking resistor is used, there are several mounting types, see chapter Mounting Types of The Modules (see page 59).

## Mounting in Slot 2

The standard braking resistor is factory-mounted in slot 2 . No further steps are required.

Mounting in Slot 1
The standard braking resistor can also be mounted in slot 1 .

- Loosen the 2 fastening screws and remove the standard braking resistor from slot 2.
- Remove the cover film, plug the standard braking resistor into slot 1 and fasten it by tightening the two fastening screws.

For the tightening torque see chapter Tightening Torque and Screws (see page 42).

## External Braking Resistor (Accessories)

External braking resistors are available as accessories; they are connected via a separate connection module.
Selection and rating of the external braking resistor are described in chapter Rating the Braking Resistor (see page 63). For suitable braking resistors, see chapter Accessories and Spare Parts (see page 475).

Cable Specifications

| Shield: | Required, both ends grounded |
| :--- | :--- |
| Twisted Pair: | - |
| PELV: | - |
| Cable composition: | Minimum conductor cross section: Same cross section as the <br> cross section used for the mains supply. <br> The conductors must have a sufficiently large cross section so <br> that the fuse at the mains connection can trip if required. |
| Minimum cable diameter: | $6 \mathrm{~mm} \mathrm{(0.24} \mathrm{in)}$ |
| Maximum cable diameter | $10.5 \mathrm{~mm}(0.41 \mathrm{in})$ |
| Maximum cable length: | $3 \mathrm{~m} \mathrm{(9.84} \mathrm{ft)}$ |
| Special characteristics: | Temperature resistance |

Properties of the Connection Terminals

| Connection cross section | $\mathrm{mm}^{2}$ | $0.75 \ldots 4$ (AWG $18 \ldots$ AWG 12) |
| :--- | :--- | :--- |
| Stripping length | $\mathrm{mm}(\mathrm{in})$ | $8 \ldots 9(0.31 \ldots 0.35)$ |

The spring terminals are approved for fine-stranded conductors and solid conductors. Observe the maximum permissible connection cross section. Take into account the fact that wire cable ends (ferrules) increase the conductor cross section.

Opening the Connection Module

## Wiring Diagram

Connection module for external braking resistor

## Usage of the Connection Terminals

Use the connection terminals as shown in the illustration below:

## Connecting the External Braking Resistor

The temperature of the braking resistor may exceed $250^{\circ} \mathrm{C}\left(482{ }^{\circ} \mathrm{F}\right)$ during operation.

## A WARNING

## HOT SURFACES

- Ensure that it is not possible to make any contact with a hot braking resistor.
- Do not allow flammable or heat-sensitive parts in the immediate vicinity of the braking resistor.
- Verify that the heat dissipation is sufficient by performing a test run under maximum load conditions.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

- Power off all supply voltages. Observe the safety instructions concerning electrical installation.
- Verify that no voltages are present (safety instructions).
- Open the cover.
- Open the cable gland.
- Push the cable through the cable gland.
- Connect the PE connection (ground).
- Connect the connections PBe and PB.
- Connect the cable shield to the shield clamp in the connector (large surface area contact).
- Close the cable gland.
- Close the cover.

Mounting the Connection Module

- Loosen the 2 fastening screws and remove the standard braking resistor from slot 2.
- Remove the cover film, plug the connection module for the external braking resistor into slot 1 or into slot 2 and fasten it by tightening the two fastening screws. Note the information concerning the different mounting types in chapter Mounting Types of The Modules (see page 59).

For the tightening torque see chapter Tightening Torque and Screws (see page 42).

The products are intended for industrial use and may only be operated with a permanently installed connection.

This product has a leakage current greater than 3.5 mA . If the protective ground connection is interrupted, a hazardous touch current may flow if the housing is touched.

## A. 4 DANGER

## INSUFFICIENT GROUNDING

- Use a protective ground conductor with at least $10 \mathrm{~mm}^{2}$ (AWG 6) or two protective ground conductors with the cross section of the conductors supplying the power terminals.
- Verify compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of all equipment.
- Ground the drive system before applying voltage.
- Do not use conduits as protective ground conductors; use a protective ground conductor inside the conduit.
- Do not use cable shields as protective ground conductors.

Failure to follow these instructions will result in death or serious injury.

## A WARNING

## INSUFFICIENT PROTECTION AGAINST OVERCURRENT

- Use the external fuses specified in "Technical data".
- Do not connect the product to a supply mains whose short-circuit current rating (SCCR) exceeds the value specified in the chapter "Technical Data".

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Direct current can be introduced in the protective ground conductor of this drive. If a residual current device (RCD / GFCI) or a residual current monitor (RCM) is used for protection against direct or indirect contact, the following specific types must be used:

## A WARNING

## DIRECT CURRENT CAN BE INTRODUCED INTO THE PROTECTIVE GROUND CONDUCTOR

- Use a Type A Residual Current Device (RCD / GFCI) or a Residual Current Monitor (RCM) for singlephase drives connected to a phase and to the neutral conductor.
- Use a Type B Residual Current Device (RCD / GFCI) or a Residual Current Monitor (RCM) that has approval for use with frequency inverters and is sensitive to all types of current for three-phase devices and for single-phase devices not connected to a phase and the neutral conductor.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

See chapter Residual Current Device (see page 61) for information and conditions concerning the use of a residual current device.

[^2]
## Cable Specifications

| Shield: | - |
| :--- | :--- |
| Twisted Pair: | - |
| PELV: | - |
| Cable composition: | The conductors of the cable must conform to the current <br> requirements of the drive and motor, and conform to any <br> applicable local regulations. |
| Minimum cable diameter: | $8 \mathrm{~mm} \mathrm{(0.31} \mathrm{in)}$ |
| Maximum cable diameter | $15 \mathrm{~mm} \mathrm{(0.59} \mathrm{in)}$ |
| Maximum cable length: | - |
| Special characteristics: | - |

Properties of the Connection Terminals

| Connection cross section | $\mathrm{mm}^{2}$ | $0.75 \ldots 4$ (AWG $18 \ldots$ AWG 12) |
| :--- | :--- | :--- |
| Stripping length | mm (in) | $8 \ldots 9(0.31 \ldots 0.35)$ |

The terminals are approved for stranded conductors and solid conductors. Use wire cable ends (ferrules), if possible.

Prerequisites for Connecting the Power Stage Supply
Note the following information:

- Three-phase devices may only be connected and operated via three phases.
- Use upstream mains fuses. See chapter Motor-Specific Data (see page 32) for information on fuse types and fuse ratings.
- If you use an external mains filter, the mains cable must be shielded and grounded at both ends if the length between the external mains filter and the device exceeds 200 mm ( 7.87 in ).
- See chapter Conditions for UL 508C (see page 45) for a UL-compliant design.

Opening the Connection Module

Wiring Diagram
Wiring diagram for single-phase device.

Wiring diagram for three-phase device

## Usage of the Connection Terminals

Use the connection terminals as shown in the illustration below:

1

(2)

(3)

4

## Connecting Mains Supply

- Power off all supply voltages. Observe the safety instructions concerning electrical installation.
- Verify that no voltages are present (safety instructions).
- Open the cover.
- Open the cable gland.
- Push the cable through the cable gland.
- Connect the PE connection (ground).
- Connect the connections L1 and N of single-phase devices.
- Connect the connections L1, L2 and L3 of three-phase devices.
- Close the cable gland.
- Close the cover.

Mounting the Connection Module
The module for the supply voltage can be mounted in slot 1 or in slot 2.
The selection of the slot depends on the slot in which the standard braking resistor or the connection module for the external braking resistor has been mounted.

- Remove the cover film, plug the module for the supply voltage into slot 1 or into slot 2 and fasten it by tightening the two fastening screws.

For the tightening torque see chapter Tightening Torque and Screws (see page 42).

## Commissioning Interface

## Cable Specifications

| Shield: | Required, both ends grounded |
| :--- | :--- |
| Twisted Pair: | Required |
| PELV: | Required |
| Cable composition: | $8^{*} 0.25 \mathrm{~mm}^{2},\left(8^{*} \mathrm{AWG} 22\right)$ |
| Maximum cable length: | 100 m |
| Special characteristics: | - |

## Connecting a PC

A PC with commissioning software can be connected for commissioning. The PC is connected via a bidirectional USB/RS485 converter, see chapter Accessories and Spare Parts (see page 475).

Opening the Cover of the Commissioning Interface
The cover of the commissioning interface can be opened by means of a flat blade screwdriver

Wiring Diagram
Wiring diagram PC with commissioning software

| Pin | Signal | Meaning | I/O |
| :--- | :--- | :--- | :--- |
| $1 \ldots 3$ | - | Reserved | - |
| 4 | MOD_D1 | Transmit/receive signal | RS 485 |
| 5 | MOD_D0 | Transmit/receive signal, inverted | RS 485 |
| $6 \ldots 7$ | - | Reserved | - |
| 8 | MOD_OV | Reference potential | - |

The cover of the commissioning must be closed after commissioning.

## Mounting the I/O Connection Module

The I/O module can be mounted in slot 3A or in slot 3 B .
If the standard braking resistor is used, the choice of slot is limited, see chapter Mounting Types of The Modules (see page 59).

- Check the seals for damage. You must not use devices with damaged seals.
- Remove the transport lock from slot 3A or slot 3B. Align the contacts as shown in the illustration below. Only touch the plastic, not the contacts themselves.
- Plug the I/O module into slot 3A or slot 3B. If you use slot 3B, you must first plug in the bottom catch of the module. In a second step, move the contacts towards the device and guide them into the device using your index finger.
- Plug the I/O module into slot 3A or slot 3B and fasten it by tightening the fastening screw.

Mounting the I/O module

For the tightening torque see chapter Tightening Torque and Screws (see page 42).

## Section 4.3

I/O Module with Industrial Connectors

## What Is in This Section?

This section contains the following topics:

| Topic | Page |
| :--- | :---: |
| Overview I/O Modules with Industrial Connectors | 114 |
| Logic Type | 117 |
| Connection of the Digital Inputs and Digital Outputs | 118 |
| Connection of Safety Function STO | 119 |
| Fieldbus Connection | 120 |

## Overview I/O Modules with Industrial Connectors

Connection Overview I/O Modules with Industrial Connectors (4 Digital Inputs, STO)

| Signal | Meaning | Factory settings ${ }^{(1)}$ | 1/0 |
| :---: | :---: | :---: | :---: |
| +24VDC | 24 V signal power supply (see chapter Internal 24 V Signal Power Supply (see page 28) | - | O |
| OVDC | Reference potential to +24 VDC |  | - |
| DIO | Digital input 0 | Positive Limit Switch (LIMP) | I |
| DI1 | Digital input 1 | Negative Limit Switch (LIMN) | I |
| DI2 | Digital input 2 | Reference Switch (REF) | I |
| DI3 | Digital input 3 | Freely Available | 1 |
| STO_A | Safety function STO ${ }^{(2)}$ |  | I |
| STO_COM | Reference potential for safety function $\mathrm{STO}^{(2)}$ |  | I |
| STO_B | Safety function STO ${ }^{(2)}$ |  | I |
| SHLD | Shield (grounded internally) | - |  |
| Tx+ | Ethernet transmit signal + |  | 1/0 |
| Tx- | Ethernet transmit signal - |  | I/O |
| Rx+ | Ethernet receive signal + |  | 1/O |
| Rx- | Ethernet receive signal - |  | 1/O |
| NC | Not connected | - | - |
| (1) See chapter Digital Inputs and Outputs (see page 209). <br> (2) This module requires an external supply for the safety function STO; see the information in chapter Safety function STO ("Safe Torque Off") (see page 69). |  |  |  |

Connection Overview I/O Modules with Industrial Connectors (4 Digital Inputs, 2 Digital Outputs, STO)

| Signal | Meaning | Factory settings ${ }^{(1)}$ | I/O |
| :--- | :--- | :--- | :--- |
| +24VDC | 24 V signal power supply (see chapter Internal 24 V <br> Signal Power Supply (see page 28) | - | O |
| 0VDC | Reference potential to +24VDC | - | - |
| DI0 | Digital input 0 | Positive Limit Switch (LIMP) | I |
| DI1 | Digital input 1 | Negative Limit Switch (LIMN) | I |
| DI2 | Digital input 2 | Reference Switch (REF) | I |
| DI3 | Digital input 3 | Freely Available | I |
| DQ0 | Digital output 0 | No Fault | O |
| DQ1 | Digital output 1 | - | O |

| (1) See chapter <br> (2) This module requires an external supply for the safety function STO; see the information in chapter Safety function <br> STO ("Safe Torque Off") (see page 69). |  |  |  |

Connection Overview Y-Cable (DI/DO Splitter Cable - VW3M9601)

| Signal | 6-pin | 3-pin | Connector | Meaning |
| :---: | :---: | :---: | :---: | :---: |
| +24VDC | 1 | 1 | Output | 24 V signal power supply (see chapter Internal 24 V Signal Power Supply (see page 28) |
| DQ - | 2 | 4 |  | Digital output |
| OVDC | 3 | 3 |  | Reference potential to +24VDC |
| +24VDC | 4 | 1 | Input | 24 V signal power supply (see chapter Internal 24 V Signal Power Supply (see page 28) |
| DI • | 5 | 4 |  | Digital input |
| OVDC | 6 | 3 |  | Reference potential to +24VDC |

## Logic Type

The logic type is determined by the specific reference of the module.
The I/O module with industrial connector is available in the following product versions:

- I/O module with positive logic (sinking inputs, sourcing outputs)
- I/O module with negative logic (sourcing inputs, sinking outputs)

See chapters I/O Module with Industrial Connector for Positive Logic (see page 481) and I/O Module with Industrial Connector for Negative Logic (see page 482) for an overview of the available product versions. See chapter Logic Type (see page 57) for additional information on the logic types.

## Connection of the Digital Inputs and Digital Outputs

The number of inputs and outputs depends on the product version of the I/O module.
The I/O module with industrial connector is available in the following product versions:

- I/O module with 2 signal inputs
- I/O module with 4 signal inputs
- I/O module with 4 signal inputs and 2 signal outputs

## Cable Specifications

| Shield | - |
| :--- | :--- |
| Twisted pair | - |
| PELV: | Required |
| Cable composition: | - |
| Maximum cable length: | $30 \mathrm{~m}(98.4 \mathrm{ft})$ |

Connecting the Digital Inputs

- Verify that wiring, cables and connected interfaces meet the PELV requirements.
- Connect the digital inputs.
- For the tightening torque see chapter Tightening Torque and Screws (see page 42).
- Close unused industrial connectors with a sealing cap, see chapter Industrial Plug Connectors (see page 485).

## Connection of Safety Function STO

The I/O module with industrial connector is available in the following product versions:

- I/O module without safety function STO
- I/O module with safety function STO

See chapter Safety function STO ("Safe Torque Off") (see page 69)for additional information on the safety function STO.

## Cable Specifications

| Shield | Required, one end grounded |
| :--- | :--- |
| Twisted pair | - |
| PELV: | Required |
| Cable composition: | - |
| Maximum cable length: | - |

Connecting the Safety Function STO

- Verify that wiring, cables and connected interfaces meet the PELV requirements.
- Connect the safety function in accordance with the specifications in chapter Safety function STO ("Safe Torque Off") (see page 69).
- For the tightening torque see chapter Tightening Torque and Screws (see page 42).
- Close unused industrial connectors with a sealing cap, see chapter Industrial Plug Connectors (see page 485).

## Fieldbus Connection

Cable Specifications

| Shield | Required, both ends grounded |
| :--- | :--- |
| Twisted pair | Required |
| PELV: | Required |
| Cable composition: | $8 * 0.25 \mathrm{~mm}^{2}(8$ * AWG 22) <br> Cat 5 e, no crossover cable |
| Maximum cable length: | $100 \mathrm{~m}(328 \mathrm{ft})$ |
| Connector coding: | D |

Connecting the Fieldbus

- Verify that wiring, cables and connected interfaces meet the PELV requirements.
- For the tightening torque see chapter Tightening Torque and Screws (see page 42).
- Close unused industrial connectors with a sealing cap, see chapter Industrial Plug Connectors (see page 485).

## Section 4.4

I/O Module with Spring Terminals

What Is in This Section?
This section contains the following topics:

| Topic | Page |
| :--- | :---: |
| Opening the I/O Module | 122 |
| Overview I/O Module with Spring Terminals | 123 |
| Setting the Logic Type | 124 |
| Connection of the Digital Inputs/Outputs | 125 |
| Connection of Safety Function STO | 127 |
| Fieldbus Connection | 130 |
| Connecting the Signals | 132 |
| Closing the I/O Module | 133 |

## Opening the I/O Module

- Open the I/O module.

- Screw the required cable glands into the I/O module.

Cable glands are available as accessories, see chapter Accessories and Spare Parts (see page 475).

- Close unused cable entries with a blind plug,

Use genuine accessories or cable glands with a degree of protection of at least IP65 (form sealing ring or flat sealing ring required).

For the tightening torque see chapter Tightening Torque and Screws (see page 42).

## Overview I/O Module with Spring Terminals

| Signal | Meaning | Factory settings ${ }^{(1)}$ | I/O |
| :---: | :---: | :---: | :---: |
| +24VDC | 24 V signal power supply (see chapter Internal 24 V Signal Power Supply (see page 28)) | - | O |
| OVDC | Reference potential to +24 VDC | - | - |
| DIO | Digital input 0 | Positive Limit Switch (LIMP) | I |
| DI1 | Digital input 1 | Negative Limit Switch (LIMN) | 1 |
| DI2 | Digital input 2 | Reference Switch (REF) | 1 |
| DI3 | Digital input 3 | Freely Available | 1 |
| DQ0 | Digital output 0 | No Fault | 0 |
| DQ1 | Digital output 1 | Active | 0 |
| DI_COM | Reference potential for digital inputs | - | - |
| DQ_COM | Reference potential for digital outputs | - | - |
| STO_A | Safety function STO | - | I |
| STO_COM | Reference potential for STO | - | 1 |
| STO_B | Safety function STO | - | 1 |
| Tx+ | Ethernet transmit signal + | - | I/O |
| Tx- | Ethernet transmit signal - | - | I/O |
| Rx+ | Ethernet receive signal + | - | I/O |
| Rx- | Ethernet receive signal - | - | I/O |

(1) See chapter Digital Inputs and Outputs (see page 209).

## Setting the Logic Type

The I/O module with spring terminals supports positive logic and negative logic.
See chapter Logic Type (see page 57) for additional information on the logic types.

- In the case of positive logic, the signal DI_COM and OVDC must be bridged and the signal DQ_COM and +24 VDC must be bridged.
- In the case of negative logic, the signal DI_COM and +24VDC must be bridged and the signal DQ_COM and OVDC must be bridged.
- Set the required logic type.

1 Positive logic (sinking inputs, sourcing outputs)
2 Negative logic (sourcing inputs, sinking outputs)

## Connection of the Digital Inputs/Outputs

## Cable Specifications

| Shield | - |
| :--- | :--- |
| Twisted pair | - |
| PELV: | Required |
| Cable composition: | - |
| Minimum cable diameter: | $2.5 \mathrm{~mm}(0.1 \mathrm{in})$ |
| For UL: | $5 \mathrm{~mm}(0.2 \mathrm{in})$ |
| Maximum cable diameter | $6.5 \mathrm{~mm}(0.26 \mathrm{in})$ |
| Maximum cable length: | $30 \mathrm{~m}(98.4 \mathrm{ft})$ |

Properties of the Connection Terminals

| Connection cross section (rigid) | $\mathrm{mm}^{2}$ | $0.13 \ldots 1.3$ (AWG 26 ... AWG 16) |
| :--- | :--- | :--- |
| Connection cross section (wire) | $\mathrm{mm}^{2}$ | $0.2 \ldots 0.52$ (AWG $24 \ldots$ AWG 20) |
| Stripping length | mm (in) | $8 \ldots 9(0.31 \ldots 0.35)$ |

The terminals are approved for stranded conductors and solid conductors. Use wire cable ends (ferrules), if possible.

Pin Assignment

| Signal | Meaning |
| :--- | :--- |
| DIO | Digital input 0 |
| DI1 | Digital input 1 |
| DI2 | Digital input 2 |
| DI3 | Digital input 3 |
| DQ0 | Digital output 0 |
| DQ1 | Digital output 1 |
| +24 VDC | 24 V signal power supply (see chapter Internal 24 V Signal Power Supply <br> (see page 28) |
| OVDC | Reference potential to DIO ... DI3, DQ0 and DQ1 |

## Assembling Cables

| From cable gland $\ldots$ | $\ldots$ to terminal block | Length A |
| :--- | :--- | :--- |
| P1 | T1 | $120 \mathrm{~mm}(4.72 \mathrm{in})$ |
| P1 | T2 | $105 \mathrm{~mm}(4.13 \mathrm{in})$ |
| P2 | T1 | $145 \mathrm{~mm}(5.71 \mathrm{in})$ |
| P2 | T2 | $130 \mathrm{~mm}(5.12 \mathrm{in})$ |

- (1) Decide which signals are to be routed through which cable gland.
- (2) Strip the cable jackets, length A.
- (3) Push the compression nut of the cable gland over the cable. Push the cable through the cable gland and tighten the compression nut.

## Connection of Safety Function STO

The I/O module with spring terminals supports operation without safety function STO and operation without safety function STO.
See chapter Safety function STO ("Safe Torque Off") (see page 69) for additional information on the safety function STO.

Operation Without STO
If the safety function STO is not to be used, the signal STO_A and +24VDC must be bridged, the signal STO_B and +24VDC must be bridged and the signal STO_COM and OVDC must be bridged.
The safety function STO is deactivated when the signals are bridged.

Operation with Safety Function STO
If the safety function STO is to be used, the safety function STO must be connected in accordance with the specifications in chapter Safety function STO ("Safe Torque Off") (see page 69).

## Cable Specifications

| Shield | Required, one end grounded |
| :--- | :--- |
| Twisted pair | - |
| PELV: | Required |
| Cable composition: | - |
| Minimum cable diameter: | $2.5 \mathrm{~mm}(0.1 \mathrm{in})$ |
| For UL: | $5 \mathrm{~mm} \mathrm{(0.2} \mathrm{in)}$ |
| Maximum cable diameter | $6.5 \mathrm{~mm}(0.26 \mathrm{in})$ |
| Maximum cable length: | - |

## Properties of the Connection Terminals

| Connection cross section (rigid) | $\mathrm{mm}^{2}$ | $0.13 \ldots 1.3$ (AWG 26 ... AWG 16) |
| :--- | :--- | :--- |
| Connection cross section (wire) | $\mathrm{mm}^{2}$ | $0.2 \ldots 0.52$ (AWG 24 ... AWG 20) |
| Stripping length | mm (in) | $8 \ldots 9(0.31 \ldots 0.35)$ |

The terminals are approved for stranded conductors and solid conductors. Use wire cable ends (ferrules), if possible.

Pin Assignment

| Signal | Meaning |
| :--- | :--- |
| STO_A | Safety function STO: Dual-channel connection, connection A |
| STO_B | Safety function STO: Dual-channel connection, connection B |
| STO_COM | Reference potential to STO_A and STO_B |

Shield Concept
The shield of the cables for the safety function STO must be connected to the connection STO IN (one end). Connecting one end of the shield helps to avoid ground loops.
See chapter Protected Cable Installation for Safety-Related Signals (see page 77) for additional information.

## Assembling Cables

| Length A | mm (in) | $150(5.91 \mathrm{in})$ |
| :--- | :--- | :--- |
| Length B | mm (in) | $10(0.39 \mathrm{in})$ |

- (1) Strip the cable jacket, length A.
- (2) Shorten the shield of the cable for STO_IN to length B.

Completely shorten the shield of the cable for STO_OUT.

- (3) Slide the shielding braid back over the cable jacket.
- (4) Fasten the shield with a shield foil ( $50 \times 10 \mathrm{~mm}(1.97 \times 0.39 \mathrm{in})$ ).
- (5) Push the compression nut of the cable gland over the cable.

Push the cable through the cable gland and tighten the compression nut. Verify that the shield is connected to the shield clip.

Connecting the Safety Function STO

- Verify that wiring, cables and connected interfaces meet the PELV requirements.
- Connect the safety function in accordance with the specifications in chapter Safety function STO ("Safe Torque Off") (see page 69).

## Fieldbus Connection

Cable Specifications

| Shield | Required, both ends grounded |
| :--- | :--- |
| Twisted pair | Required |
| PELV: | Required |
| Cable composition: | $8^{*} 0.25 \mathrm{~mm}^{2}(8$ * AWG 22) |
|  | Cat 5 e, no crossover cable |
| Minimum cable diameter: | $2.5 \mathrm{~mm}(0.1 \mathrm{in})$ |
| For UL: | $5 \mathrm{~mm} \mathrm{(0.2} \mathrm{in)}$ |
| Maximum cable diameter | $6.5 \mathrm{~mm} \mathrm{(0.26} \mathrm{in)}$ |
| Maximum cable length: | $100 \mathrm{~m} \mathrm{(328} \mathrm{ft)}$ |

Properties of the Connection Terminals

| Connection cross section (rigid) | $\mathrm{mm}^{2}$ | $0.13 \ldots 1.3$ (AWG 26 ... AWG 16) |
| :--- | :--- | :--- |
| Connection cross section (wire) | $\mathrm{mm}^{2}$ | $0.2 \ldots 0.52$ (AWG 24 ... AWG 20) |
| Stripping length | mm (in) | $8 \ldots 9(0.31 \ldots 0.35)$ |

The terminals are approved for stranded conductors and solid conductors. Use wire cable ends (ferrules), if possible.

Pin Assignment

| Signal | Meaning |
| :--- | :--- |
| $T x+$ | Ethernet transmit signal + |
| $T x-$ | Ethernet transmit signal - |
| $R x+$ | Ethernet receive signal + |
| $R x^{-}$ | Ethernet receive signal - |

## Assembling Cables

(1)

(2)

(3)

(4)

(5)

| Length A | $\mathrm{mm}(\mathrm{in})$ | $95(3.74)$ |
| :--- | :--- | :--- |
| Length B | $\mathrm{mm}(\mathrm{in})$ | $10(0.39)$ |

- (1) Strip the cable jacket of the cables for $\mathrm{X1}$ (IN) and X 2 (OUT), length $A$.
- (2) Shorten the shield to length B.
- (3) Slide the shielding braid back over the cable jacket.
- (4) Fasten the shield with a shield foil ( $50 \times 10 \mathrm{~mm}(1.97 \times 0.39 \mathrm{in})$ ).
- (5) Push the compression nut of the cable gland over the cable.

Push the cable through the cable gland and tighten the compression nut. Verify that the shield is connected to the shield clip.

## Connecting the Signals

- Strip the individual wires.

Use wire cable ends (ferrules).

- (1) Connect the signal wires for the digital inputs and outputs to the terminals.
- (2) If you want to use the safety function STO, connect the signal wires for the safety function STO to the terminals.
- (3) Fasten the signal wires for the digital inputs and outputs and the signal wires for the safety function STO with cable ties.
- (4) Connect the signal wires for the fieldbus to the terminals.

Twist the wires for the corresponding fieldbus connections by 1 to 2 turns. Twisting improves the signal quality and facilitates inserting the cables into the chambers as well as closing the cover.

## Closing the I/O Module

- Place the cables into the cover of the I/O module.
- Close the cover of the I/O module, starting at the fieldbus connection end.

Verify that no cables are between the clamps in the area of the fieldbus connection.

- Close the 4 clamps of the module.

## Section 4.5 <br> Verifying Installation

## Verifying Installation

Verify proper installation:

- Verify the mechanical installation of the entire drive system:
- Does the installation meet the specified distance requirements?
- Did you tighten all fastening screws with the specified tightening torque?
- Verify the electrical connections and the cabling:
- Did you connect all protective ground conductors?
- Do all fuses have the correct rating; are the fuses of the specified type?
- Did you connect all wires of the cables or insulate them?
- Did you properly connect and install all cables and connectors?
- Are the mechanical locks of the connectors correct and effective?
- Did you properly connect the signal wires?
- Are the required shield connections EMC-compliant?
- Did you take all measures for EMC compliance?
- Does the drive installation conform to all local, regional, and national electrical safety codes for the eventual placement of the equipment?
- Verify that all covers and seals have been properly installed to achieve the required degree of protection.
If the safety function STO and spring terminals are used:
- Verify conductive connection between cable shield of STO (IN) and ground.

## Chapter 5

## Commissioning

What Is in This Chapter?
This chapter contains the following sections:

| Section | Topic | Page |
| :--- | :--- | :---: |
| 5.1 | Overview | 136 |
| 5.2 | Fieldbus Integration | 142 |
| 5.3 | Commissioning Procedure | 152 |
| 5.4 | Controller Optimization with Step Response | 172 |
| 5.5 | Parameter Management | 183 |

## Section 5.1

## Overview

What Is in This Section?
This section contains the following topics:

| Topic | Page |
| :--- | :---: | :---: |
| General | 137 |
| Preparation | 140 |

The safety function STO (Safe Torque Off) does not remove power from the DC bus. The safety function STO only removes power to the motor. The DC bus voltage and the mains voltage to the drive are still present.

## A. 1 DANGER

## ELECTRIC SHOCK

- Do not use the safety function STO for any other purposes than its intended function.
- Use an appropriate switch, that is not part of the circuit of the safety function STO, to disconnect the drive from the mains power.

Failure to follow these instructions will result in death or serious injury.

External driving forces acting on the motor can cause high currents to be regenerated and supplied back to the drive.

## 4 DANGER

FIRE DUE TO EXTERNAL DRIVING FORCES ACTING ON MOTOR
Verify that no external forces can act on the motor in the case of errors of error classes 3 or 4.
Failure to follow these instructions will result in death or serious injury.

Unsuitable parameter values or unsuitable data may trigger unintended movements, trigger signals, damage parts and disable monitoring functions. Some parameter values or data do not become active until after a restart.

| A WARNING |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| - Only start the system if there are no persons or obstructions in the zone of operation. |
| - Do not operate the drive system with undetermined parameter values or data. |
| - Never modify a parameter value unless you fully understand the parameter and all effects of the |
| modification. |
| - Restart the drive and verify the saved operational data and/or parameter values after modifications. |
| - Carefully run tests for all operating states and potential error situations when commissioning, |
| upgrading or otherwise modifying the operation of the drive. |
| - Verify the functions after replacing the product and also after making modifications to the parameter |
| values and/or other operational data. |

Failure to follow these instructions can result in death, serious injury, or equipment damage.

If the power stage is disabled unintentionally, for example as a result of power outage, errors or functions, the motor is no longer decelerated in a controlled way.

| WNARNING |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| Verify that movements without braking effect cannot cause injuries or equipment damage. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

Applying the holding brake while the motor is running will cause excessive wear and degradation of the braking torque.

| LOSS OF BRAKING FORCE DUE TO WEAR OR HIGH TEMPERATURE |
| :--- |
| LING |
| - Do not use the holding brake as a service brake. |
| - Do not exceed the maximum number of brake applications and the kinetic energy during braking of |
| moving loads. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

When the product is operated for the first time, there is a risk of unanticipated movements caused by, for example, incorrect wiring or unsuitable parameter settings. Releasing the holding brake can cause an unintended movement, like for example, a falling load in the case of vertical axes.

## A WARNING

## UNINTENDED MOVEMENT

- Verify that there are no persons or obstructions in the zone of operation when operating the system.
- Take appropriate measures to avoid hazards caused by falling or lowering loads or other unintended movements.
- Run initial tests without coupled loads.
- Verify that a functioning emergency stop push-button is within reach of all persons involved in running tests.
- Anticipate movements in unintended directions or oscillations of the motor.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

The metal surfaces of the product may exceed $70^{\circ} \mathrm{C}\left(158^{\circ} \mathrm{F}\right)$ during operation.

## A CAUTION

## HOT SURFACES

- Avoid unprotected contact with hot surfaces.
- Do not allow flammable or heat-sensitive parts in the immediate vicinity of hot surfaces.
- Verify that the heat dissipation is sufficient by performing a test run under maximum load conditions.

Failure to follow these instructions can result in injury or equipment damage.

The product can be accessed via different types of access channels. Simultaneous access via multiple access channels or the use of exclusive access may cause unintended equipment operation.

| WARNING |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| - Verify that simultaneous access via multiple access channels cannot cause unintended triggering or |
| blocking of commands. |
| - Verify that the use of exclusive access cannot cause unintended triggering or blocking of commands. |
| - Verify that the required access channels are available. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

If the drive was not connected to mains for an extended period of time, the capacitors must be restored to their full performance before the motor is started.

## NOTICE <br> REDUCED CAPACITOR PERFORMANCE <br> - If the drive has not been connected to mains for a period of more than 24 months, apply mains voltage to the drive for at least one hour before enabling the power stage for the first time. <br> - If the drive is commissioned for the first time, verify the date of manufacture and run the procedure specified above if the date of manufacture is more than 24 months in the past.

Failure to follow these instructions can result in equipment damage.

## Preparation

## Required Components

The following is required for commissioning:

- Commissioning software "Lexium DTM Library" http://www.schneider-electric.com/en/download/document/Lexium DTM Library/
- Fieldbus converter for the commissioning software for connection via the commissioning interface
- GSD file http://www.schneider-electric.com
- PROFINET IO controller

Interfaces
The following interfaces can be used for commissioning, parameterization and diagnostics:

1 PC with commissioning software "Lexium DTM Library"
2 Fieldbus
Device settings can be duplicated. Stored device settings can be transferred to a device of the same type. Duplicating the device settings can be used if multiple devices are to have the same settings, for example, when devices are replaced.

## Commissioning Software

The commissioning software "Lexium DTM Library" has a graphic user interface and is used for commissioning, diagnostics and testing settings.

- Tuning of the control loop parameters via a graphical user interface
- Comprehensive set of diagnostics tools for optimization and maintenance
- Long-term trace for evaluation of the performance
- Testing the input and output signals
- Tracking signals on the screen
- Archiving of device settings and recordings with export function for further processing in other applications

GSD File
The properties of an IO device are described in a GSD file (General Station Description). The GSD file is provided by the manufacturer of the product and must be read using the configuration tool of the IO controller.
The GSD file contains information on the operation of the IO device on the PROFINET network.

- Manufacturer information
- Profile class (IO device)
- Device identification
- Time intervals
- Settings of inputs and outputs

The GSD file for this product can be downloaded from the Internet at:

[^3]Opening the Cover of the Commissioning Interface
The following components can be found below the cover of the commissioning interface:

- DIP switches for fieldbus, IP-address and device name
- Card holder for the memory card
- Commissioning interface CN10

The cover of the commissioning interface can be opened by means of a flat blade screwdriver

The CN10 interface does not support devices without their own power supply.
Use standard RJ45 patch cables.
The cover of the commissioning must be closed after commissioning.

A PC with commissioning software can be connected for commissioning. The PC is connected to a bidirectional USB/RS485 converter, see chapter Accessories and Spare Parts (see page 475).

## Section 5.2

## Fieldbus Integration

What Is in This Section?
This section contains the following topics:

| Topic | Page |
| :--- | :---: |
| Selecting the Fieldbus | 143 |
| Setting the IP Address | 144 |
| Setting the Device Name | 147 |
| Settings with the Configuration Tool STEP7 - V13 (TIA Portal) | 148 |
| Settings with the Configuration Tool STEP7 - V5 | 150 |

## Selecting the Fieldbus

## Overview

The fieldbus to be used with the device has to be set.

Factory Setting
The factory setting for the fieldbus is Reserved.

Settings
Set the fieldbus of the device to PROFINET.
The fieldbus can be set via the DIP switches or via the parameter FieldbusSelection.
Setting the fieldbus via DIP switches:

Changed settings become active the next time the product is powered on.

| Value decimal | Value bit-coded | Meaning |
| :--- | :--- | :--- |
| 0 | 000 | Fieldbus can be set via parameter FieldbusSelection. |
| 2 | 010 | Fieldbus PROFINET |

Setting the fieldbus via parameter (only if the DIP switches are set to value 0 ):

| Parameter name | Description | Unit <br> Minimum value Factory setting Maximum value | Data type <br> R/W <br> Persistent <br> Expert | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| FieldbusSelec- <br> tion | Fieldbus selection <br> 1 / Reserved: Reserved <br> 2 / PROFINET: PROFINET <br> The fieldbus can be selected with this parameter if the DIP switches are set to 0 . Changed settings become active the next time the product is powered on. <br> 3... 7 / Reserved: Reserved | $\begin{aligned} & - \\ & 1 \\ & 1 \\ & 7 \end{aligned}$ | UINT16 R/W per. | Modbus 15912 PROFINET 15912 |

## Setting the IP Address

## Overview

The IP address of the device can be set by means of the following methods:

- DCP (Discovery Configuration Protocol)
- Manual setting

Factory Setting
The factory setting for the IP address is DCP.
This setting does not have to be changed if the DCP sever of the IO controller (logic or motion controller) is used.

Settings
If a connection is to be established without the configuration tool of the IO controller, the IP address can also be set manually.

| WNARNING |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| - Verify that the devices have unique IP addresses. |
| - Verify that you use the correct IP address to address the intended device. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

The method of obtaining the IP address can be set via the DIP switches or via the parameter PntIpMode. Setting the method via DIP switches:

Changed settings become active the next time the product is powered on.

| Value decimal | Value bit-coded | Meaning |
| :--- | :--- | :--- |
| 0 | 00 | Method can be set via parameter PntIpMode. |
| 3 | 11 | IP address via DCP |

Setting the method via parameter (only if the DIP switches are set to value 0 ):

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value | Data type <br> R/W <br> Persistent <br> Expert | Parameter <br> address via <br> fieldbus |
| :--- | :--- | :--- | :--- | :--- |
|  |  | - | UINT16 | Modbus 18436 |
| Pnt IpMode | Type of obtaining IP address | 0 | R/W | PROFINET 18436 |
|  | 0 / Manual: Manual | 3 / DCP: DCP | 3 | per. |

Set the parameter to the value "Manual" if you want to set the IP address manually.
The IP address can be set manually via the commissioning software Lexium DTM Library.
The parameters PntIPAddress 1 ... PntIPAddress 4 let you set the IP address.

| Parameter name | Description | Unit <br> Minimum value Factory setting Maximum value | Data type R/W <br> Persistent Expert | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| PntIPAddress1 | IP address, byte 1 <br> Changed settings become active the next time the product is powered on. | $\begin{aligned} & - \\ & 0 \\ & 0 \\ & 255 \end{aligned}$ | UINT16 R/W per. | Modbus 18446 <br> PROFINET 18446 |
| PntIPAddress2 | IP address, byte 2 <br> Changed settings become active the next time the product is powered on. | 0 255 | UINT16 R/W per. | Modbus 18448 <br> PROFINET 18448 |
| PntIPAddress3 | IP address, byte 3 <br> Changed settings become active the next time the product is powered on. | 0 0 $255$ | UINT16 R/W per. | Modbus 18450 <br> PROFINET 18450 |
| PntIPAddress 4 | IP address, byte 4 Changed settings become active the next time the product is powered on. | 0 0 $255$ | UINT16 <br> R/W <br> per. | Modbus 18452 <br> PROFINET 18452 |

The parameters PntIPmask1 ... PntIPmask 4 let you set the subnet mask.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value | Data type R/W <br> Persistent Expert | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| PntIPmask1 | IP address subnet mask, byte 1 Changed settings become active the next time the product is powered on. | 0 $255$ $255$ | UINT16 R/W per. | Modbus 18454 <br> PROFINET 18454 |
| PntIPmask2 | IP address subnet mask, byte 2 Changed settings become active the next time the product is powered on. | $\begin{aligned} & 0 \\ & 255 \\ & 255 \end{aligned}$ | UINT16 R/W per. | Modbus 18456 PROFINET 18456 |
| PntIPmask3 | IP address subnet mask, byte 3 Changed settings become active the next time the product is powered on. | 0 255 255 | UINT16 R/W per. | Modbus 18458 PROFINET 18458 |
| PntIPmask4 | IP address subnet mask, byte 4 Changed settings become active the next time the product is powered on. | 0 <br> 0 255 | UINT16 R/W per. | Modbus 18460 PROFINET 18460 |

The parameters PntIPgate1 ... PntIPgate4 let you set the gateway.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value | Data type <br> R/W <br> Persistent <br> Expert | Parameter <br> address via <br> fieldbus |
| :--- | :--- | :--- | :--- | :--- |
| PntIPgate1 | IP address gateway, byte 1 <br> Changed settings become active the next <br> time the product is powered on. | 0 <br> 0 | UINT16 <br> R/W <br> per. | Modbus 18462 |
|  |  | 255 | PROFINET 18462 |  |
| PntIPgate2 | IP address gateway, byte 2 <br> Changed settings become active the next <br> time the product is powered on. | - <br> 0 | UINT16 <br> R/W | Modbus 18464 <br> PROFINET 18464 <br> per. |
|  |  | 255 | - |  |

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value | Data type <br> R/W <br> Persistent <br> Expert | Parameter <br> address via <br> fieldbus |
| :--- | :--- | :--- | :--- | :--- |

|  |  | 255 | - | - |

## Setting the Device Name

## Overview

The device name consists of two parts:

- Device name text
- Device name extension (additional numbers appended with a "-")

Example: UserDefinedName-123
Each device must have a unique device name on the network.

## Factory Setting

The device name is "empty" (no device name text is set and the device name extension is set to 0 ).

## Setting the Device Name Text

The device name text can be set via the PROFINET commissioning software "PRONETA" or via the configuration tool of the IO controller.
If no user-defined device name text is set, but if a device name extension is set, then the device name text is set automatically to lxm32i.

## Setting the Device Name Extension

The value set via the device name extension is appended to the device name text with a "-". The additional number is appended either to the user-defined device name text or to the automatic device name text.
The device name extension can be set via the DIP switches or via the parameter DevNameExtAddr.
Setting the device name extension via DIP switches:

Modified settings become active the next time the product is powered on.

| Value bit-coded | Value decimal | Meaning |
| :--- | :--- | :--- |
| 0000000 | 0 | Device name extension can be set via parameter <br> DevNameExtAddr. |
| $0000001 \ldots 1111111$ | $1 \ldots 127$ | Value of the device name extension |

Setting the device name extension via parameter (only if the DIP switches are set to value 0 ):

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value | Data type <br> R/W <br> Persistent <br> Expert | Parameter <br> address via <br> fieldbus |
| :--- | :--- | :--- | :--- | :--- |
| DevNameExtAddr | Value for device name extension <br> (PROFINET) | - | UINT16 <br> R/W <br> PROFINET: The device name extension <br> can be set with this parameter if the DIP <br> switches are set to 0. <br> Changed settings become active the next <br> time the product is powered on. | Modbus 15906 <br> PROFINET 15906 |
| 0 | - |  |  |  |

Settings with the Configuration Tool STEP7 - V13 (TIA Portal)

GSD File
The GSD file must be read with the configuration tool of the IO controller. The device is then known to the network.
In the Hardware catalog, select the device "Schneider Electric LXM32iETH" from the list.

Mapping for "_v_act"
In the drive profile "Drive Profile Lexium 1", the double word "_v_act" can be parameterized. In the properties of the drive profile "Drive Profile Lexium 1", you can select the parameter _v_act (actual velocity) or _n_act (actual speed of rotation).

\section*{Additional Parameters in "Optional Data"}

The configuration tool of the IO controller lets you set the additional parameters to be transmitted in the output data and the input data in the range "Optional Data".
There are up to 8 slots in which 8 additional parameters can be set. The total length of the data frame of the output data and the input data must not exceed 40 bytes.
Set the required additional parameters in slots \(2 \ldots 9\) in the Device overview.

\section*{Setting Limit Values}

\section*{Setting Limit Values}

Suitable limit values must be determined and calculated on the basis of the system and motor data. As long as the motor is operated without loads, the default settings do not need to be changed.

\section*{Current Limitation}

The maximum motor current can be set with the parameter CTRL_I_max.
The maximum current for the "Quick Stop" function can be limited with the parameter LIM_I_maxQSTP and for the "Halt" function with the parameter LIM_I_maxHalt.
- Use the parameter CTRL_I_max to set the maximum motor current.
- Use the parameter LIM_I_maxQSTP to set the maximum motor current for the "Quick Stop" function.
- Use the parameter LIM_I_maxHalt to set the maximum motor current for the "Halt" function.

The motor can be decelerated via a deceleration ramp or the maximum current for the functions "Quick Stop" and "Halt".
The device limits the maximum permissible current on the basis of the motor data and the device data. Even if the value entered for the maximum current in the parameter CTRL_I_max is too high, the value is limited.

\section*{Digital Inputs and Outputs}

The device has configurable inputs and configurable outputs. See chapter Digital Inputs and Outputs (see page 209) for additional information.
The signal states of the digital inputs and digital outputs can be displayed via the fieldbus and the commissioning software.

\section*{Fieldbus}

The signal states are contained in the parameter _IO_act in a bit-coded way. The values " 1 " and "0" correspond to the signal state of the input or output.
\begin{tabular}{|l|l|l|l|l|}

\section*{Verifying the Signals of the Limit Switches}

The use of limit switches can provide some protection against hazards (for example, collision with mechanical stop caused by incorrect reference values)

\section*{A WARNING}

LOSS OF CONTROL
- Ensure that limit switches are installed as determined by your risk assessment.
- Verify correct connection of the limit switches.
- Verify that the limit switches are sufficiently distant from the mechanical stop to allow an adequate stopping distance.
- Verify correct parameterization and function of the limit switches

Failure to follow these instructions can result in death, serious injury, or equipment damage.
- Set up the limit switches in such a way as to keep the motor from overtraveling the limit switches.
- Trigger the limit switches manually.

If an error message is indicated, the limit switches were triggered.
Parameters can be used to release the limit switches and to set them up as normally closed contacts or normally open contacts, see chapter Limit Switches (see page 310).

\section*{Verifying the Safety Function STO}

Operation with Safety Function STO
If you want to use the safety function STO, carry out the following steps:
- To help avoid unintended restart after restoration of power, the parameter IO_AutoEnable must be set to "off". Verify that the parameter IO_AutoEnable is set to "off".

Power off the power supply:
- Verify that the signal wires at the inputs (STO_A) and (STO_B) are isolated from each other. The two signal wires must not be electrically connected.
Power on the power supply:
- Enable the power stage without starting a motor movement.
- Trigger the safety function STO.

If the power stage is now disabled and the error message 1300 is indicated, the safety function STO was triggered.
If a different error message is indicated, the safety function STO was not triggered.
- Document all tests of the safety function in your acceptance protocol.

Operation without Safety Function STO
I/O modules with industrial connectors are available without the safety function STO.
If an I/O module with spring terminals is used:
- Verify that the inputs STO_A and STO_B are connected to +24VDC. For details see chapter Connection of Safety Function STO (see page 127).

\section*{Holding Brake (Option)}

Holding Brake
The holding brake in the motor has the task of holding the motor position when the power stage is disabled. The holding brake is not a safety function and not a service brake.

\section*{A WARNING}

\section*{UNINTENDED AXIS MOVEMENT}
- Do not use the internal holding brake as a safety-related measure.
- Only use certified external brakes as safety-related measures.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

\section*{Releasing the Holding Brake}

When the power stage is enabled, current is applied to the motor. When current is applied to the motor, the holding brake is automatically released.

Releasing the holding brake requires a certain amount of time. This time is contained in the electronic nameplate of the motor. Transition to the operating state 6 Operation Enabled is only possible after this time delay has elapsed.

\section*{Applying the Holding Brake}

When the power stage is disabled, the holding brake is automatically applied.
However, applying the holding brake requires a certain amount of time. This time is contained in the electronic nameplate of the motor. Current remains to be applied to the motor during this time delay

See chapter Safety function STO ("Safe Torque Off") (see page 69) for additional information on the behavior of the holding brake when the safety function STO is triggered.

Releasing the Holding Brake Manually
Mechanical adjustments may require you to manually rotate the motor shaft.
Manual release of the holding brake is only possible in the operating states 3 Switch On Disabled,
4 Ready To Switch On or 9 Fault.
When the product is operated for the first time, there is a risk of unanticipated movements caused by, for example, incorrect wiring or unsuitable parameter settings. Releasing the holding brake can cause an unintended movement, like for example, a falling load in the case of vertical axes.
\begin{tabular}{l}
\hline \\
\hline UNINTENDED MOVEMENT \\
- Verify that there are no persons or obstructions in the zone of operation when operating the system. \\
- Take appropriate measures to avoid hazards caused by falling or lowering loads or other unintended \\
movements. \\
- Run initial tests without coupled loads. \\
- Verify that a functioning emergency stop push-button is within reach of all persons involved in running \\
tests. \\
- Anticipate movements in unintended directions or oscillations of the motor. \\
Failure to follow these instructions can result in death, serious injury, or equipment damage. \\
\hline
\end{tabular}

\section*{Applying the Holding Brake Manually}

For testing the holding brake, you may want to manually apply the holding brake.
You can only apply the holding brake manually when the motor is at a standstill.
If you enable the power stage after the holding brake has been applied manually, the holding brake remains applied.

Manual application of the holding brake has priority over automatic and manual release of the holding brake.

If a movement is started after the holding brake has been applied manually, this can cause wear.
\begin{tabular}{l} 
NOT/CE \\
\hline BRAKE WEAR AND LOSS OF BRAKING TORQUE \\
- Verify that the generated motor torque is not greater than the holding torque of the holding brake if you \\
have applied the holding brake manually. \\
- Only apply the holding brake manually for the purpose of testing the holding brake. \\
Failure to follow these instructions can result in equipment damage. \\
\hline
\end{tabular}

\section*{Releasing the Holding Brake Manually via a Signal Input}

In order to release the holding brake via a signal input, you must first parameterize the signal input function "Release Holding Brake", see chapter Digital Inputs and Outputs (see page 209).

\section*{Releasing or Applying the Holding Brake Manually via the Fieldbus}

The parameter BRK_release can be used to release the holding brake via the fieldbus.
\begin{tabular}{|c|c|c|c|c|}

PROFINET 2068
\end{tabular} \\
\hline
\end{tabular}

\section*{Verifying the Direction of Movement}

\section*{Definition of Direction of Movement}

In the case of a rotary motors, direction of movement is defined in accordance with IEC 61800-7-204: Positive direction is when the motor shaft rotates clockwise as you look at the end of the protruding motor shaft.

It is important to maintain the IEC 61800-7-204 directional standard within your application because many motion-related function blocks, programming conventions, and, safety-related and conventional devices expect this underlying assumption within their logic and operational methodologies.

\section*{A WARNING}

UNINTENDED MOVEMENT CAUSED BY INTERCHANGED MOTOR PHASES
Do not interchange the motor phases.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

If your application requires an inversion of the direction of movement, you can parameterize the direction of movement.

The direction of movement can be verified by starting a movement.

\section*{Verifying the Direction of Movement via the Commissioning Software}

Power supply has been powered on.
- Enable the power stage.
- Start the operating mode Jog.
- Use the ">" button to trigger a movement in positive direction. A movement is made in positive direction.
- Use the "<" button to trigger a movement in negative direction. A movement is made in negative direction.

\section*{Verifying the Direction of Movement via Signal Inputs}

The signal input functions "Jog Positive With Enable" and "Jog Negative With Enable" enable the power stage, start the operating mode Jog and trigger a movement in positive direction or in negative direction.
The signal input functions "Jog Positive With Enable" and "Jog Negative With Enable" must have been parameterized, see chapter Digital Inputs and Outputs (see page 209).
Power supply has been powered on.
- Use the signal input function "Jog Positive With Enable" to trigger a movement in positive direction. A movement is made in positive direction.
- Use the signal input function "Jog Negative With Enable" to trigger a movement in negative direction. A movement is made in negative direction.

Changing the Direction of Movement
You can invert the direction of movement.
- Inversion of direction of movement is off:

Movements are made in positive direction with positive target values.
- Inversion of direction of movement is on:

Movements are made in positive direction with negative target values.
The parameter InvertDirOfMove allows you to invert the direction of movement.

\end{tabular}

\section*{Working Range of the Encoder}

The working range of the singleturn encoder is 131072 increments per turn.
The working range of the multiturn encoder is 4096 turns with 131072 increments per turn.

\section*{Underrun of Absolute Position}

If a rotary motor performs a movement from 0 into negative direction, there is an underrun of the absolute position of the encoder. However, the actual position keeps counting forward and delivers a negative position value. After a power cycle, the actual position no longer corresponds to the negative position value, but to the absolute position of the encoder.

The following options are available to adjust the absolute position of the encoder:
- Adjustment of the absolute position
- Shifting the working range

\section*{Adjustment of the Absolute Position}

When the motor is at a standstill, the new absolute position of the motor can be set to the current mechanical motor position the with the parameter ENC1_adjustment.
Adjusting the absolute position also shifts the position of the index pulse.
- Set the absolute position at the negative mechanical limit to a position value greater than 0 . This way, the movements remain within the continuous range of the encoder.
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}

PROFINET 1346
\end{tabular} \\
\hline
\end{tabular}

\section*{Setting the Braking Resistor Parameters}

An insufficiently rated braking resistor can cause overvoltage on the DC bus. Overvoltage on the DC bus causes the power stage to be disabled. The motor is no longer actively decelerated.
\begin{tabular}{|l|}
\hline \\
\hline UNINTENDED EQUIPMENT OPERATION \\
- Verify that the braking resistor has a sufficient rating by performing a test run under maximum load \\
conditions. \\
- Verify that the parameter settings for the braking resistor are correct. \\
Failure to follow these instructions can result in death, serious injury, or equipment damage. \\
\hline
\end{tabular}

The temperature of the braking resistor may exceed \(250^{\circ} \mathrm{C}\left(482{ }^{\circ} \mathrm{F}\right)\) during operation.

\section*{A WARNING}

\section*{HOT SURFACES}
- Ensure that it is not possible to make any contact with a hot braking resistor.
- Do not allow flammable or heat-sensitive parts in the immediate vicinity of the braking resistor.
- Verify that the heat dissipation is sufficient by performing a test run under maximum load conditions.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

If you use an external braking resistor, perform the following steps:
- Set the parameter RESint ext to "External Braking Resistor".
- Set the parameters RESext_P, RESext_R and RESext_ton.

See chapter Rating the Braking Resistor (see page 63) for additional information.
If the regenerated power becomes greater than the power that can be absorbed by the braking resistor, an error message is generated and the power stage is disabled.

\section*{Autotuning}

Autotuning moves the motor in order to tune the control loops. Incorrect parameters may cause unintended movements or the loss of monitoring functions.

\section*{A WARNING}

\section*{UNINTENDED MOVEMENT}
- Only start the system if there are no persons or obstructions in the zone of operation.
- Verify that the values for the parameters AT_dir and AT_dis_usr (AT_dis) do not exceed the available movement range.
- Verify that the parameterized movement ranges are available, free and clear for the mechanical movement defined by your application logic.
- Include in your calculations when determining the available movement range, the additional distance for the deceleration ramp in the case of an emergency stop.
- Verify that the parameter settings for a Quick Stop are correct.
- Verify correct operation of the limit switches.
- Verify that a functioning emergency stop push-button is within reach of all persons involved in all phases of machine operation and maintenance involving this equipment.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

\section*{Autotuning}

Autotuning determines the friction torque as a constantly acting load torque and considers it in the calculation of the moment of inertia of the entire system.
External factors such as a load at the motor are considered. Autotuning optimizes the settings of the control loop parameters; see chapter Controller Optimization with Step Response (see page 172).
Autotuning also supports vertical axes.

\section*{Methods}

There are three ways of tuning the drive control loops:
- Easy Tuning: Automatic - autotuning without user intervention. For most applications, autotuning yields good, highly dynamic results.
- Comfort Tuning: Semi-automatic - autotuning with user intervention. Parameters for direction and parameters for damping can be set by the user.
- Manual: The user can set and tune the control loop parameters manually. Expert mode.

\section*{Function}

During autotuning, the motor is activated and small movements are made. Noise development and mechanical oscillations of the system are normal.

If you want to perform Easy Tuning, no additional parameters need to be adjusted. To perform Comfort Tuning, the parameters AT_dir, AT_dis_usr (AT_dis) and AT_mechanics are available to be adjusted to meet the requirements of your application.

The parameter AT_Start is used to start Easy Tuning or Comfort Tuning.
- Start autotuning via the commissioning software.
- Save the new settings to the EEPROM via the commissioning software.

The product features 2 control loop parameter sets that can be parameterized separately. The values for the control loop parameters determined during autotuning are stored in control loop parameter set 1.
If autotuning cancels with an error message, the default values are used. Change the mechanical position and restart autotuning. If you want to verify the plausibility of the calculated values, you can have them displayed; see chapter Enhanced Settings for Autotuning (see page 170).

\section*{Section 5.4}

\section*{Controller Optimization with Step Response}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Controller Structure & 173 \\
\hline Optimization & 175 \\
\hline Optimizing the Velocity Controller & 176 \\
\hline Verifying and Optimizing the P Gain & 180 \\
\hline Optimizing the Position Controller & 181 \\
\hline
\end{tabular}

\section*{Controller Structure}

The controller structure corresponds to the classical cascaded closed loop with current controller, velocity controller and position controller. In addition, the reference value of the velocity controller can be smoothed via a filter.

The controllers are tuned one after the other from the "inside" to the "outside" in the following sequence: current control, velocity control, position control. The superimposed control loop remains off.

1 Position controller
2 Velocity Loop Controller
3 Current controller
4 Encoder evaluation
See chapter Overview of the Controller Structure (see page 220) for a detailed description of the controller structure.

\section*{Current Controller}

The current controller determines the torque of the motor. The current controller is automatically optimally tuned with the stored motor data.

\section*{Velocity Controller}

The velocity controller controls the motor velocity by varying the motor current depending on the load situation. The velocity controller has a decisive influence on the dynamic response of the drive. The dynamics of the velocity controller depend on:
- Moment of inertia of the drive and the controlled system
- Power of the motor
- Stiffness and elasticity of the elements in the flow of forces
- Backlash of the drive elements
- Friction

\section*{Position Controller}

The position controller reduces the difference between the reference position and the actual position of the motor (position deviation) to a minimum. When the motor is at a standstill, the position deviation is close to zero in the case of a well-tuned position controller.

An optimized velocity control loop is a prerequisite for good amplification of the position controller.

\section*{Control Loop Parameters}

This device allows you to use two control loop parameter sets. It is possible to switch form one set of control loop parameter sets to the other during operation. The active control loop parameter set is selected with the parameter CTRL_SelParSet.

The corresponding parameters are CTRL1_xx for the first control loop parameter set and CTRL2_xx for the second control loop parameter set. The following descriptions use the notation CTRL1_xx (CTRL2_xx) if there are no functional differences between the two control loop parameter sets.
\begin{tabular}{|c|c|c|c|c|}

\end{tabular}

\section*{Optimization}

The drive optimization function matches the device to the application conditions. The following options are available:
- Selecting control loops. Upstream control loops are automatically deactivated.
- Defining reference value signals: signal type, amplitude, frequency and starting point
- Testing control performance with the signal generator.
- Recording the control performance on screen and evaluating it with the commissioning software.

\section*{Setting Reference Value Signals}

Start controller optimization with the commissioning software.
Set the following values for the reference value signal:
- Signal type: Step "positive"
- Amplitude: \(100 \mathrm{~min}^{-1}\)
- Cycle duration: 100 ms
- Number of repetitions: 1
- Start the trace.

Only the signal types "Step" and "Square" allow you to determine the entire dynamic behavior of a control loop. The manual shows signal paths for the signal type "Step".

\section*{Entering Values for Optimization}

The optimization steps described on the following pages require you to enter control loop parameters and test their effect by triggering a step function.
A step function is triggered as soon as you start a trace in the commissioning software.

\section*{Control Loop Parameters}

This device allows you to use two control loop parameter sets. It is possible to switch form one set of control loop parameter sets to the other during operation. The active control loop parameter set is selected with the parameter CTRL_SelParSet.

The corresponding parameters are CTRL1_xx for the first control loop parameter set and CTRL2_xx for the second control loop parameter set. The following descriptions use the notation CTRL1_xx (CTRL2_xx) if there are no functional differences between the two control loop parameter sets.
For details see chapter Switching Between Control Loop Parameter Sets (see page 219).

\section*{Optimizing the Velocity Controller}

Optimizing complex mechanical control systems require hands-on experience with controller tuning. This includes the ability to calculate control loop parameters and to apply identification procedures.
Less complex mechanical systems can often be optimized by means of experimental adjustment using the aperiodic limit method. The following parameters are used for this:
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}

\end{tabular} \\
\hline
\end{tabular}

Verify and optimize the calculated values in a second step, see chapter Verifying and Optimizing the \(P\) Gain (see page 180).

\section*{Reference Value Filter of the Velocity Controller}

The reference value filter of the velocity controller allows you to improve the transient response at optimized velocity control. The reference value filter must be deactivated for the first setup of the velocity controller.
- Deactivate the reference value filter of the velocity controller. Set the parameter CTRL1_TAUnref (CTRL2 TAUnref) to the lower limit value " 0 ".
\begin{tabular}{|c|c|c|c|c|}

PROFINET 4872
\end{tabular} \\
\hline
\end{tabular}

\section*{Determining the Type of Mechanical System}

To assess and optimize the transient response behavior of your system, group its mechanical system into one of the following two categories.
- System with rigid mechanical system
- System with a less rigid mechanical system

Rigid and less rigid mechanical systems

\section*{Rigid \\ mechanical system}
low elasticity

e. g. Direct drive Rigid coupling

\section*{Less rigid} mechanical system
higher elasticity

e. g. Belt drive

Weak drive shaft Elastic coupling

\section*{Determining Values for Rigid Mechanical Systems}

In the case of a rigid mechanical system, adjusting the control performance on the basis of the table is possible if:
- the moment of inertia of the load and of the motor are known and
- the moment of inertia of the load and of the motor are constant

The P gain CTRL_KPn and the integral action time CTRL_TNn depend on:
- \(J_{L}\) : Moment of inertia of the load
- \(J_{\mathrm{M}}\) : Moment of inertia of the motor
- Determine the values on the basis of the following table:
\begin{tabular}{|l|l|l|l|l|l|l|}
\hline & \multicolumn{2}{|l|}{\(\mathrm{J}_{\mathrm{L}}=\mathrm{J}_{\mathrm{M}}\)} & \multicolumn{2}{l|}{\(\mathrm{J}_{\mathrm{L}}=5^{*} \mathrm{~J}_{\mathrm{M}}\)} & \multicolumn{2}{l|}{\(\mathrm{J}_{\mathrm{L}}=10{ }^{*} \mathrm{~J}_{\mathrm{M}}\)} \\
\hline \(\mathrm{J}_{\mathrm{L}}\) & KPn & TNn & KPn & TNn & KPn & TNn \\
\hline \(1 \mathrm{kgcm}^{2}\) & 0.0125 & 8 & 0.008 & 12 & 0.007 & 16 \\
\hline \(2 \mathrm{kgcm}^{2}\) & 0.0250 & 8 & 0.015 & 12 & 0.014 & 16 \\
\hline \(5 \mathrm{kgcm}^{2}\) & 0.0625 & 8 & 0.038 & 12 & 0.034 & 16 \\
\hline \(10 \mathrm{kgcm}^{2}\) & 0.125 & 8 & 0.075 & 12 & 0.069 & 16 \\
\hline \(20 \mathrm{kgcm}^{2}\) & 0.250 & 8 & 0.150 & 12 & 0.138 & 16 \\
\hline
\end{tabular}

\section*{Determining Values for Less Rigid Mechanical Systems}

For optimization purposes, determine the P gain of the velocity controller at which the controller adjusts velocity _v_act as quickly as possible without overshooting.
- Set the integral action time CTRL1_TNn (CTRL2_TNn) to infinite (= 327.67 ms ).

If a load torque acts on the motor when the motor is at a standstill, the integral action time must not exceed a value that causes unwanted changes of the motor position.

If the motor is subject to loads when it is at a standstill, setting the integral action time to "infinite" may cause position deviations (for example, in the case of vertical axes). Reduce the integral action time if the position deviation is unacceptable in your application. However, reducing the integral action time can adversely affect optimization results.

\section*{A WARNING \\ UNINTENDED MOVEMENT \\ - Only start the system if there are no persons or obstructions in the zone of operation. \\ - Verify that the values for the velocity and the time do not exceed the available movement range. \\ - Verify that a functioning emergency stop push-button is within reach of all persons involved in the operation. \\ Failure to follow these instructions can result in death, serious injury, or equipment damage.}
- Trigger a step function.
- After the first test, verify the maximum amplitude for the reference value for the current _Iq_ref.

Set the amplitude of the reference value just high enough so the reference value for the current Iq ref remains below the maximum value CTRL_I max. On the other hand, the value selected should not be too low, otherwise friction effects of the mechanical system will determine the performance of the control loop.
- Trigger another step function if you had to modify _v_ref and verify the amplitude of _Iq_ref.
- Increase or decrease the P gain in small increments until _v_act is obtained as fast as possible. The following diagram shows the required transient response on the left. Overshooting - as shown on the right - is reduced by reducing CTRL1_KPn (CTRL2_KPn).
Differences between _v_ref and _v_act result from setting CTRL1_TNn (CTRL2_TNn) to "Infinite".

Determining "TNn" for the aperiodic limit

In the case of drive systems in which oscillations occur before the aperiodic limit is reached, the P gain "KPn" must be reduced until oscillations can no longer be detected. This occurs frequently in the case of linear axes with a toothed belt drive.

Graphic Determination of the \(63 \%\) Value
Graphically determine the point at which the actual velocity _v_act reaches \(63 \%\) of the final value. The integral action time CTRL1_TNn (CTRL2_TNn) then results as a value on the time axis. The commissioning software supports you with the evaluation:
\begin{tabular}{|l|l|l|l|l|}

\end{tabular}

Verifying and Optimizing the P Gain

Step responses with good control performance

The controller is properly set when the step response is approximately identical to the signal shown. Good control performance is characterized by
- Fast transient response
- Overshooting up to a maximum of \(40 \%, 20 \%\).

If the control performance does not correspond to the curve shown, change CTRL_KPn in increments of about \(10 \%\) and then trigger another step function:
- If the control is too slow: Use a higher CTRL1_KPn (CTRL2_KPn) value.
- If the control tends to oscillate: Use a lower CTRL1_KPn (CTRL2_KPn) value.

Oscillation ringing is characterized by continuous acceleration and deceleration of the motor.
Optimizing insufficient velocity controller settings

\section*{Optimizing the Position Controller}

An optimized velocity controller is a prerequisite for optimization of the position controller.
When tuning the position controller, you must optimize the P gain CTRL1_KPp (CTRL2_KPp):
- CTRL1_KPp (CTRL2_KPp) too high: Overshooting, instability
- CTRL1_KPp (CTRL2_KPp) too low: High position deviation
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}
Unit \\
Minimum value \\
Factory setting \\
Maximum value
\end{tabular} & \begin{tabular}{l}

& 900.0
\end{aligned}
\] & UINT16 R/W per. & \begin{tabular}{l}
Modbus 4870 \\
PROFINET 4870
\end{tabular} \\
\hline
\end{tabular}

The step function moves the motor at constant velocity until the specified time has expired.

\section*{A WARNING}

\section*{UNINTENDED MOVEMENT}
- Only start the system if there are no persons or obstructions in the zone of operation.
- Verify that the values for the velocity and the time do not exceed the available movement range.
- Verify that a functioning emergency stop push-button is within reach of all persons involved in the operation.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

\section*{Setting the Reference Value Signal}
- Select Position Controller as the reference value in the commissioning software.
- Set the reference value signal:
- Signal type: "Step"
- For rotary motors: Set the amplitude to approx. 1/10 motor revolution.

The amplitude is entered in user-defined units. With the default scaling, the resolution is 16384 userdefined units per motor revolution.

\section*{Selecting the Trace Signals}
- Select the values in the box General Trace Parameters:
- Reference position of position controller _p_refusr (_p_ref)
- Actual position of position controller _p_actusr (_p_act)
- Actual velocity _v_act
- Reference value current _Iq_ref

\section*{Optimizing the Position Controller Value}
- Trigger a step function with the default controller values.
- After the first test, verify the values achieved for _v_act and _Iq_ref for current control and velocity control. The values must not reach the current and velocity limitation range.

Step responses of a position controller with good control performance

The p gain setting CTRL1_KPp (CTRL2_KPp) is optimal if the reference value is reached rapidly and with little or no overshooting.

If the control performance does not correspond to the curve shown, change the P gain CTRL1_KPp (CTRL2_KPp) in increments of approximately 10\% and trigger another step function.
- If the control tends to oscillate: Use a lower KPp value.
- If the actual value is too slow reaching the reference value: Use a higher KPp value.

Optimizing inadequate position controller settings

\section*{Section 5.5}

\section*{Parameter Management}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Memory Card & 184 \\
\hline Duplicating Existing Parameter Values & 186 \\
\hline Resetting the User Parameters & 187 \\
\hline Restoring Factory Settings & 188 \\
\hline
\end{tabular}

\section*{Memory Card}

The devices features a card holder for a memory card. The parameters stored on the memory card can be transferred to other devices. If a device is replaced, a new device of the same type can be operated with identical parameters.

The contents of the memory card is compared to the parameters stored in the device when the device is powered on.

When the parameters are written to the EEPROM, they are also saved to the memory card.

Note the following:
- Use only genuine accessory memory cards.
- Do not touch the gold contacts.
- The insert/remove cycles of the memory card are limited.
- The memory card can remain in the device.
- The memory card can only be removed from the device by pulling (not by pushing).

\section*{Inserting a Memory Card}
- Power supply has been powered off.
- Place the memory card in front of the the card holder. The slanted corner must be aligned as shown on the printed circuit board. Push the memory card into the device.
- Switch on the power supply.

Observe the memory card LED during the initialization of the device. See chapter Memory card LEDs (see page 353) for information on the meaning of the LED signals.

\section*{Writing Data to the Memory Card}

The memory card is empty. Power supply has been powered off.
- Insert the memory card. The slanted corner must be aligned as shown on the printed circuit board.
- Switch on the power supply.

The device data is transferred to the memory card. Observe the memory card LED and the error memory of the device.

\section*{Transferring Data From the Memory Card to the Device}

The memory card contains a parameter set of a device with the same fieldbus and of the same size. Power supply has been powered off.
- Insert the memory card. The slanted corner must be aligned as shown on the printed circuit board.
- Switch on the power supply.

The data on the memory card is transferred to the device. Observe the memory card LED and the error memory of the device.
- Check the fieldbus address settings.
- Switch the power supply off and on again to apply the new configuration.

\section*{Memory Card Has Been Removed}

If there is no memory card in the device (or if the memory card has not been detected), the memory card LED is off.

Write Protection for Memory Card
It is possible to write-protect the memory card. For example, you may want to write-protect memory cards used for regular duplication of device data.
Memory cards are write-protected via the commissioning software.

\section*{Duplicating Existing Parameter Values}

\section*{Application}

Multiple devices are to have the same settings, for example, when devices are replaced.

Prerequisites
- Device type, motor type and firmware version must be identical.
- The DIP switches for the fieldbus must be set identical, see chapter Selecting the Fieldbus (see page 143).
- Tools for duplication:
- Memory card
- Commissioning software
- The controller supply must be powered on.

\section*{Duplication Using a Memory Card}

Device settings can be stored on a memory card (accessories).
The stored device settings can be copied to a device of the same type. Note that the fieldbus address and the settings for the monitoring functions are copied along with this information.

\section*{Duplication Using the Commissioning Software}

The commissioning software can save the settings of a device in the form of a configuration file. The stored device settings can be copied to a device of the same type. Note that the fieldbus address and the settings for the monitoring functions are copied along with this information.
See the manual for the commissioning software for additional information.

\section*{Resetting the User Parameters}

The user parameters are reset by means of the parameter PARuserReset.
- Disconnect the drive from the fieldbus.
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}
Unit \\

\end{tabular} \\
\hline
\end{tabular}

Resetting via the Commissioning Software
Use the menu items "Device -> User Functions -> Reset User Parameters" in the commissioning software to reset the user parameters.
If the device transitions to the operating state " 2 Not Ready To Switch On" after the user parameters are reset, the new settings only become active until after the device is powered off and on again.

\section*{Restoring Factory Settings}

The parameter values, both active and those saved in non-volatile memory, are lost in this process.

\section*{NOTICE}

\section*{LOSS OF DATA}

Perform a backup of the drive parameters prior to restoring factory settings (factory established parameter values).

Failure to follow these instructions can result in equipment damage.

The commissioning software allows you to save the parameter values set for a device as a configuration file. For information on saving the existing parameters in the drive, see chapter Parameter Management (see page 183).
The factory settings are restored by means of the parameter PARfactorySet.
\begin{tabular}{|l|l|l|l|l|}

\end{tabular}

Factory Settings via Commissioning Software
Use the menu items "Device -> User Functions -> Restore factory Settings" in the commissioning software to restore the factory settings.
The new settings only become active until after the device is powered off and on again.

\section*{Chapter 6}

\section*{Operation}

What Is in This Chapter?
This chapter contains the following sections:
\begin{tabular}{|l|l|c|}
\hline Section & \multicolumn{1}{|c|}{ Topic } & Page \\
\hline 6.1 & Access Channels & 190 \\
\hline 6.2 & Movement Range & 191 \\
\hline 6.3 & Modulo Range & 196 \\
\hline 6.4 & Scaling & 204 \\
\hline 6.5 & Digital Inputs and Outputs & 209 \\
\hline 6.6 & Switching Between Control Loop Parameter Sets & 219 \\
\hline
\end{tabular}

\section*{Section 6.1}

\section*{Access Channels}

\section*{Access Channels}

The product can be accessed via different types of access channels. Simultaneous access via multiple access channels or the use of exclusive access may cause unintended equipment operation.
\begin{tabular}{|l|}
\hline \\
\hline UNINTENDED EQUIPMENT OPERATION \\
- Verify that simultaneous access via multiple access channels cannot cause unintended triggering or \\
blocking of commands. \\
- Verify that the use of exclusive access cannot cause unintended triggering or blocking of commands. \\
- Verify that the required access channels are available. \\
Failure to follow these instructions can result in death, serious injury, or equipment damage. \\
\hline
\end{tabular}

The product can be addressed via different access channels. Access channels are:
- Fieldbus
- Commissioning software
- Digital signal inputs

Only one access channel can have exclusive access to the product. An exclusive access can be provided via different access channels:
- Via a fieldbus:

Exclusive access is provided to a fieldbus by blocking the other access channels with the parameter AccessLock.
- Via the commissioning software:

The commissioning software receives exclusive access via the switch "Exclusive access" in position "On".
When the product is powered on, there is no exclusive access via an access channel.
The signal input functions "Halt", "Fault Reset", "Enable", "Positive Limit Switch (LIMP)", "Negative Limit Switch (LIMN)" and "Reference Switch (REF)" as well as the signals of the safety function STO (STO_A and STO_B) are always effective during exclusive access.

\section*{Section 6.2 \\ Movement Range}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Size of the Movement Range & 192 \\
\hline Movement Beyond the Movement Range & 193 \\
\hline Setting a Modulo Range & 195 \\
\hline
\end{tabular}

\section*{Size of the Movement Range}

The movement range is the maximum possible range within which a movement can be made to any position.
The actual position of the motor is the position in the movement range.
The figure below shows the movement range in user-defined units with the factory scaling.

A -268435456 user-defined units (usr_p)
B 268435455 user-defined units (usr_p)

Availability
The movement range is relevant in the following operating modes:
- Jog
- Profile Position
- Homing

Zero Point of the Movement Range
The zero point is the point of reference for absolute movements in the operating mode Profile Position.

Valid Zero Point
The zero point of the movement range is set by means of a reference movement or by position setting. A reference movement and position setting can be performed in the operating mode Homing.
In the case of a movement beyond the movement range (for example, a relative movement), the zero point becomes invalid.

\section*{Movement Beyond the Movement Range}

The behavior in the case of a movement beyond the movement range depends on the operating mode and the type of movement.
The following behavior is possible:
- In the case of a movement beyond the movement range, the movement range restarts.
- In the case of a movement with a target position outside of the movement range, position setting to 0 is performed before the movement is started.
The behavior can be set by means of the parameter PP_ModeRangeLim.
\begin{tabular}{|l|l|l|l|l|}

\end{tabular}

Behavior for Operating Mode Jog (Continuous Movement)
Behavior for continuous movement beyond the movement range:
- The movement range restarts.

Behavior for Operating Mode Jog (Step Movement)
Behavior for step movement beyond the movement range:
- Parameter PP_ModeRangeLim = 1:

The movement range restarts.
- Parameter PP_ModeRangeLim = 0:

Internal position setting to 0 .

Behavior for Operating Mode Profile Position (Relative Movement)
Behavior for relative movement beyond the movement range:
- Parameter PP_ModeRangeLim = 1:

The movement range restarts.
A relative movement is possible when the motor is at a standstill and during movements
- Parameter PP_ModeRangeLim \(=0\) :

Internal position setting to 0 .
A relative movement is only possible when the motor is at a standstill.

Behavior for Operating Mode Profile Position (Absolute Movement)
Behavior for absolute movement:
- Parameter PP_ModeRangeLim=1:

A relative movement beyond the movement range is possible.
- Parameter PP_ModeRangeLim \(=0\) :

An absolute movement is made within the movement range. A relative movement beyond the movement range is not possible.

Example:
Actual position: 268435000 user-defined units (usr_p)
Target position absolute: -268435000 user-defined units (usr_p)

A -268435456 user-defined units (usr_p)
B 268435455 user-defined units (usr_p)
1 Actual position: 268435000 user-defined units
2 Absolute movement to -268435000 user-defined units with parameter PP ModeRangeLim \(=1\)
3 Absolute movement to - 268435000 user-defined units with parameter PP_-ModeRangeLim \(=0\)

\section*{Setting a Modulo Range}

Description
The modulo range supports applications with repeating arrangements of target positions (such as rotary indexing tables). The target positions are mapped to a parameterizable movement range.
For details see chapter Setting a Modulo Range (see page 197).

\section*{Section 6.3}

\section*{Modulo Range}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Setting a Modulo Range & 197 \\
\hline Parameterization & 198 \\
\hline Examples with Relative Movements & 200 \\
\hline Examples with Absolute Movements and "Shortest Distance" & 201 \\
\hline Examples with Absolute Movements and "Positive Direction" & 202 \\
\hline Examples with Absolute Movements and "Negative Direction" & 203 \\
\hline
\end{tabular}

\section*{Setting a Modulo Range}

\section*{Description}

The modulo range supports applications with repeating arrangements of target positions (such as rotary indexing tables). The target positions are mapped to a parameterizable movement range.

\section*{Direction of Movement}

The direction of movement for absolute target positions can be adjusted to meet the requirements of the application.
- Shortest distance
- Positive direction of movement only
- Negative direction of movement only

\section*{Multiple Modulo Range}

In addition, it is possible to set a multiple modulo range for absolute target positions. A movement with an absolute target position beyond the modulo range is performed in a way as if several modulo ranges had been arranged one after the other.
Example:
- Modulo range
- Minimum position: 0 usr_p
- Maximum position: 3600 usr_p
- Actual position: 700 usr_p
- Target positions absolute: 5000 usr_p
- Left: Without multiple modulo range

Right: With multiple modulo range
Multiple modulo range

\section*{Parameterization}

Overview
Overview of parameters

Scaling
Using a modulo range requires the scaling to be adapted. The scaling of the motor must be adapted to the requirements of the application, see chapter Scaling (see page 204).

Activation
The modulo range is activated with the parameter MOD_Enable.
\begin{tabular}{|l|l|l|l|l|}

\section*{Examples with Relative Movements}

\section*{Assumptions}

The settings below are assumed for the examples.
- Rotary motor
- Position scaling
o Numerator: 1
o Denominator: 3600
- Modulo range
- Minimum position: 0 usr_p
- Maximum position: 3600 usr_p
- Actual position: 700 usr_p

Example 1
Target positions relative: 500 usr_p and 3300 usr_p

Example 2
Target positions relative: -500 usr_p and -3300 usr_p

\section*{Examples with Absolute Movements and "Shortest Distance"}

\section*{Assumptions}

\section*{Section 6.4}

\section*{Scaling}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline General & 205 \\
\hline Configuration of position scaling & 206 \\
\hline Configuration of Velocity Scaling & 207 \\
\hline Configuration of Ramp Scaling & 208 \\
\hline
\end{tabular}

\section*{General}

Scaling converts user-defined units into internal units of the device, and vice versa.

\section*{User-Defined Units}

Values for positions, velocities, acceleration and deceleration are specified in the following user-defined unit:
- usr_p for positions
- usr_v for velocities
- usr_a for acceleration and deceleration

Modifying the scaling modifies the ratio between user-defined units and internal units. After a modification to the scaling, one and the same value of a parameter specified in a user-defined unit causes a different movement than before the modification. A modification of the scaling affects all parameters whose values are specified in user-defined units.

\section*{A WARNING}

UNINTENDED MOVEMENT
- Verify all parameters with user-defined units before modifying the scaling factor.
- Verify that a modification of the scaling factor cannot cause unintended movements.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

\section*{Scaling Factor}

The scaling factor is the relationship between the motor movement and the required user-defined units.

\section*{Commissioning Software}

You can adjust the scaling via the commissioning software. The parameters with user-defined units are automatically checked and adjusted.

\section*{Configuration of position scaling}

Position scaling is the relationship between the number of motor revolutions and the required user-defined units (usr_p).

\section*{Scaling Factor}

Position scaling is specified by means of scaling factor:
In the case of a rotary motor, the scaling factor is calculated as shown below:
Number of revolutions of the motor

Number of user-defined units [usr_p]

A new scaling factor is activated when you specify the numerator value
With a scaling factor of \(<1 / 131072\), it is not possible to perform a movement outside of the movement range.

Factory Setting
The following factory settings are used:
- 1 motor revolution corresponds to 16384 user-defined units
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}
Unit \\

Modbus 1550 \\
PROFINET 1550
\end{tabular} \\
\hline
\end{tabular}

\section*{Configuration of Velocity Scaling}

\section*{Scaling Factor}

Velocity scaling is specified by means of scaling factor:
In the case of a rotary motor, the scaling factor is calculated as shown below:
\(\qquad\)
Number of user-defined units [usr_v]

\section*{Factory Setting}

The following factory settings are used:
- 1 motor revolution per minute corresponds to 1 user-defined unit
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}
Unit \\

\end{tabular} \\
\hline
\end{tabular}

\section*{Configuration of Ramp Scaling}

Ramp scaling is the relationship between the change in velocity and the required user-defined units (usr_a).

Scaling Factor
Ramp scaling is specified by means of scaling factor:
Velocity change per second
Number of user-defined units [usr_a]

Factory Setting
The following factory settings are used:
- A change of 1 motor revolution per minute per second corresponds to 1 user-defined unit.
\begin{tabular}{|l|l|l|l|l|}
\hline Parameter name & Description & \begin{tabular}{l} 
Unit \\

\section*{Section 6.5}

Digital Inputs and Outputs

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Parameterization of the Signal Input Functions & 210 \\
\hline Parameterization of the Signal Output Functions & 215 \\
\hline Parameterization of Software Debouncing & 218 \\
\hline
\end{tabular}

\section*{Parameterization of the Signal Input Functions}

Signal Input Function
Various signal input functions can be assigned to the digital signal inputs.
\begin{tabular}{|l|}
\hline \\
\hline UNINTENDED EQUIPMENT OPERATION \\
- Verify that the wiring is appropriate for the settings. \\
- Only start the system if there are no persons or obstructions in the zone of operation. \\
- Carefully run tests for all operating states and potential error situations when commissioning, \\
upgrading or otherwise modifying the operation of the drive. \\
Failure to follow these instructions can result in death, serious injury, or equipment damage. \\
\hline
\end{tabular}

Factory Settings
The table below shows the factory settings of the digital signal inputs:
\begin{tabular}{|l|l|}
\hline Signal & Signal input function \\
\hline DI0 & Positive Limit Switch (LIMP) \\
\hline DI1 & Negative Limit Switch (LIMN) \\
\hline DI2 & Reference Switch (REF) \\
\hline DI3 & Freely Available \\
\hline
\end{tabular}

Parameterization
The table below provides an overview of the possible signal input functions:
\begin{tabular}{|l|l|}
\hline Signal input function & Description in chapter \\
\hline Freely Available & Setting a Signal Output via Parameter (see page 299) \\
\hline Fault Reset & Changing the Operating State via Signal Inputs (see page 244) \\
\hline Enable & Changing the Operating State via Signal Inputs (see page 244) \\
\hline Halt & Stop Movement with Halt (see page 292) \\
\hline Start Profile Positioning & Starting a Movement via a Signal Input (see page 300) \\
\hline Current Limitation & Limitation of the Current via Signal Inputs (see page 297) \\
\hline Zero Clamp & Zero Clamp (see page 298) \\
\hline Velocity Limitation & Limitation of the Velocity via Signal Inputs (see page 296) \\
\hline Reference Switch (REF) & Reference Switch (see page 311) \\
\hline Positive Limit Switch (LIMP) & Limit Switches (see page 310) \\
\hline Negative Limit Switch (LIMN) & Limit Switches (see page 310) \\
\hline Switch Controller Parameter Set & Switching Between Control Loop Parameter Sets (see page 219) \\
\hline Velocity Controller Integral Off & Switching Between Control Loop Parameter Sets (see page 219) \\
\hline Start Signal Of RMAC & Relative Movement After Capture (RMAC) (see page 304) \\
\hline Activate RMAC & Relative Movement After Capture (RMAC) (see page 304) \\
\hline Jog Positive With Enable & Operating Mode Jog (see page 250) \\
\hline Jog Negative With Enable & Operating Mode Jog (see page 250) \\
\hline Release Holding Brake & Releasing the Holding Brake Manually (see page 158) \\
\hline
\end{tabular}

The following parameters can be used to parameterize the digital signal inputs:
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}
Unit \\

\section*{Parameterization of the Signal Output Functions}

\section*{Signal Output Function}

Various signal output functions can be assigned to the digital signal outputs.
In the case of a detected error the state of the signal outputs remains active according to assigned signal output function.
\begin{tabular}{l}
\hline \multicolumn{1}{|c|}{ WNARNING } \\
\hline UNINTENDED EQUIPMENT OPERATION \\
- Verify that the wiring is appropriate for the settings. \\
- Only start the system if there are no persons or obstructions in the zone of operation. \\
- Carefully run tests for all operating states and potential error situations when commissioning, \\
upgrading or otherwise modifying the operation of the drive. \\
Failure to follow these instructions can result in death, serious injury, or equipment damage. \\
\hline
\end{tabular}

Factory Settings
The table below shows the factory settings of the digital signal outputs:
\begin{tabular}{|l|l|}
\hline Signal & Signal output function \\
\hline\(D Q 0\) & No Fault \\
\hline DQ1 & Active \\
\hline
\end{tabular}

Parameterization
The table below provides an overview of the possible signal output functions:
\begin{tabular}{|l|l|}
\hline Signal output function & Description in chapter \\
\hline Freely Available & Setting a Signal Output via Parameter (see page 299) \\
\hline No Fault & Indication of the Operating State via Signal Inputs (see page 242) \\

\section*{Parameterization of Software Debouncing}

Debounce Time
Signal input debouncing comprises hardware debouncing and software debouncing.
Hardware debounce time is permanently set, see Signals (see page 28).
When a set signal function is changed and when the product is powered off and on again, software debouncing is reset to the factory setting.

The software debounce time can be set via the following parameters.
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}
Unit \\
Minimum value \\
Factory setting \\
Maximum value
\end{tabular} & \begin{tabular}{l}

\section*{Section 6.6 \\ Switching Between Control Loop Parameter Sets}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Overview of the Controller Structure & 220 \\
\hline Overview of Position Controller & 221 \\
\hline Overview of Velocity Controller & 222 \\
\hline Overview of Current Controller & 223 \\
\hline Parameterizable Control Loop Parameters & 224 \\
\hline Selecting a Control Loop Parameter Set & 225 \\
\hline Automatically Switching Between Control Loop Parameter Sets & 226 \\
\hline Copying a Control Loop Parameter Set & 230 \\
\hline Deactivating the Integral Term & 231 \\
\hline Control Loop Parameter Set 1 & 232 \\
\hline Control Loop Parameter Set 2 & 234 \\
\hline
\end{tabular}

\section*{Overview of the Controller Structure}

The illustration below provides an overview of the controller structure.

1 Position controller
2 Velocity controller
3 Current controller
4 Encoder evaluation

Position Controller
The position controller reduces the difference between the reference position and the actual position of the motor (position deviation) to a minimum. When the motor is at a standstill, the position deviation is close to zero in the case of a well-tuned position controller.
An optimized velocity control loop is a prerequisite for good amplification of the position controller.

\section*{Velocity Controller}

The velocity controller controls the motor velocity by varying the motor current depending on the load situation. The velocity controller has a decisive influence on the dynamic response of the drive. The dynamics of the velocity controller depend on:
- Moment of inertia of the drive and the controlled system
- Power of the motor
- Stiffness and elasticity of the elements in the flow of forces
- Backlash of the drive elements
- Friction

Current Controller
The current controller determines the torque of the motor. The current controller is automatically optimally tuned with the stored motor data.

\section*{Overview of Position Controller}

The illustration below provides an overview of the position controller.

1 Target values for the operating modes Jog, Profile Position and Homing
2 Motion profile for the velocity
3 Velocity feed-forward control
4 Position controller

\section*{Sampling Period}

The sampling period of the position controller is \(250 \mu \mathrm{~s}\).

\section*{Overview of Velocity Controller}

The illustration below provides an overview of the velocity controller.

1 Target values for the operating mode Profile Velocity
2 Motion profile for the velocity
3 Velocity limitation
4 Overshoot suppression filter (parameter accessible in Expert mode)
5 Filter time constant of the reference velocity value filter
6 Acceleration feed forward control (parameter accessible in Expert mode)
7 Friction compensation (parameter accessible in Expert mode)
8 Velocity Loop Controller

\section*{Sampling Period}

The sampling period of the velocity controller is \(62.5 \mu \mathrm{~s}\).

\section*{Overview of Current Controller}

The illustration below provides an overview of the current controller.

1 Target values for the operating mode Profile Torque
2 Motion profile for the torque
3 Current limitation
4 Notch filter (parameter accessible in Expert mode)
5 Filter time constant of the reference current value filter
6 Current controller
7 Power stage

\section*{Sampling Period}

The sampling period of the current controller is \(62.5 \mu \mathrm{~s}\).

\section*{Parameterizable Control Loop Parameters}

Control Loop Parameter Set
The product features 2 control loop parameter sets that can be parameterized separately. The values for the control loop parameters determined during autotuning are stored in control loop parameter set 1.
A control loop parameter set consists of freely accessible parameters and parameters which are only accessible in Expert mode.
\begin{tabular}{|l|l|}
\hline Control loop parameter set 1 & Control loop parameter set \(\mathbf{2}\) \\
\hline Freely accessible parameters: & Freely accessible parameters: \\

See chapters Control Loop Parameter Set 1 (see page 232) and Control Loop Parameter Set 2 (see page 234).

\section*{Parameterization}
- Selecting a control loop parameter set

Select a control loop parameter set after switching on.
See chapter Selecting a Control Loop Parameter Set (see page 225).
- Automatically switching between control loop parameter sets

It is possible to switch between the two control loop parameter sets.
See chapter Automatically Switching Between Control Loop Parameter Sets (see page 226).
- Copying a control loop parameter set

The values of control loop parameter set 1 can be copied to control loop parameter set 2.
See chapter Copying a Control Loop Parameter Set (see page 230).
- Deactivating the integral term

The integral term and, by implication, the integral action time, can be deactivated via a digital signal input.
See chapter Deactivating the Integral Term (see page 231).

\section*{Selecting a Control Loop Parameter Set}

The active control loop parameter set is indicated via the parameter _CTRL_ActParSet.
The parameter CTRL_PwrUpParSet allows you to set the control loop parameter set to be activated after powering on. Alternatively, you can set whether or not the product is to switch automatically between the two control loop parameter sets.
The parameter CTRL_SelParSet allows you to switch between the two control loop parameter sets during operation.

\section*{Automatically Switching Between Control Loop Parameter Sets}

It is possible to automatically switch between the two control loop parameter sets.
The following criteria can be set for switching between the control loop parameter sets:
- Digital signal input
- Position deviation window
- Target velocity below parameterizable value
- Actual velocity below parameterizable value

\section*{Settings}

The illustration below provides an overview of switching between the parameter sets.

Time Chart
The freely accessible parameters are changed linearly. This linear change of the values of control loop parameter set 1 to the values of control loop parameter set 2 takes place during the parameterizable time CTRL_ParChgTime.

The parameters only accessible in Expert mode are directly changed to the values of the other control loop parameter set after the parameterizable time CTRL ParChgTime has passed.

The figure below shows the time chart for switching the control loop parameters.
Time chart for switching the control loop parameter sets

1 Freely accessible parameters are changed linearly over time
2 Parameters which are only accessible in Expert mode are switched over directly

\hline
\end{tabular}

\section*{Deactivating the Integral Term}

The integral term of the velocity controller can be deactivated via the signal input function "Velocity Controller Integral Off". If the integral term is deactivated, the integral action time of the velocity controller (CTRL1_TNn and CTRL2_TNn) is implicitly and gradually reduced to zero. The time it takes to reduce the value to zero depends on the parameter CTRL_ParChgTime. In the case of vertical axes, the integral term is needed to reduce position deviations during standstill.

\section*{Chapter 7}

\section*{Operating States and Operating Modes}

What Is in This Chapter?
This chapter contains the following sections:
\begin{tabular}{|l|l|c|}
\hline Section Topic & Page \\
\hline 7.1 & Operating States & 238 \\
\hline 7.2 & Indicating, Starting and Changing an Operating Mode & 247 \\
\hline 7.3 & Operating Mode Jog & 250 \\
\hline 7.4 & Operating Mode Profile Torque & 258 \\
\hline 7.5 & Operating Mode Profile Velocity & 263 \\
\hline 7.6 & Operating Mode Profile Position & 267 \\
\hline 7.7 & Operating Mode Homing & 272 \\
\hline
\end{tabular}

\section*{Section 7.1}

\section*{Operating States}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline State Diagram and State Transitions & 239 \\
\hline Indication of the Operating State via Signal Outputs & 242 \\
\hline Indication of the Operating State via Fieldbus & 243 \\
\hline Changing the Operating State via Signal Inputs & 244 \\
\hline Changing the Operating State via Fieldbus & 246 \\
\hline
\end{tabular}

\section*{State Diagram and State Transitions}

\section*{State Diagram}

When the product is powered on and when an operating mode is started, the product goes through a number of operating states.
The state diagram (state machine) shows the relationships between the operating states and the state transitions.
The operating states are internally monitored and influenced by monitoring functions.

\section*{Operating States}
\begin{tabular}{|l|l|}
\hline Operating state & Description \\
\hline 1 Start & Electronics are initialized \\
\hline 2 Not Ready To Switch On & The power stage is not ready to switch on \\
\hline 3 Switch On Disabled & Impossible to enable the power stage \\
\hline 4 Ready To Switch On & The power stage is ready to switch on. \\
\hline 5 Switched On & Power stage is switched on \\
\hline 6 Operation Enabled & \begin{tabular}{l} 
Power stage is enabled \\
Selected operating mode is active
\end{tabular} \\
\hline 7 Quick Stop Active & "Quick Stop" is being executed \\
\hline 8 Fault Reaction Active & Error response is active \\
\hline 9 Fault & \begin{tabular}{l} 
Error response terminated \\
Power stage is disabled
\end{tabular} \\
\hline
\end{tabular}

\section*{Error Class}

The errors are classified according to the following error classes:
\begin{tabular}{|l|l|l|l|}
\hline Error class & State transition & Error response & Resetting an error message \\
\hline 0 & - & No interruption of the movement & Function "Fault Reset" \\
\hline 1 & T11 & Stop movement with "Quick Stop" & Function "Fault Reset" \\
\hline 2 & T13, T14 & \begin{tabular}{l} 
Stop movement with "Quick Stop" and disable \\
the power stage when the motor has come to a \\
standstill
\end{tabular} & Function "Fault Reset" \\
\hline 3 & T13, T14 & \begin{tabular}{l} 
Disable the power stage immediately without \\
stopping the movement first
\end{tabular} & Function "Fault Reset" \\
\hline 4 & T13, T14 & \begin{tabular}{l} 
Disable the power stage immediately without \\
stopping the movement first
\end{tabular} & Power cycle \\
\hline
\end{tabular}

\section*{Error Response}

The state transition T13 (error class 2, 3 or 4) initiates an error response as soon as an internal occurrence signals an error to which the device must react.
\begin{tabular}{|l|l|}
\hline Error class & Response \\
\hline 2 & \begin{tabular}{l} 
Movement is stopped with "Quick Stop" \\
Holding brake is applied \\
Power stage is disabled
\end{tabular} \\
\hline \begin{tabular}{l}
3,4 or Safety function \\
STO
\end{tabular} & Power stage is immediately disabled \\
\hline
\end{tabular}

An error can be triggered by a temperature sensor, for example. The product cancels the current movement and triggers an error response. Subsequently, the operating state changes to 9 Fault.

\section*{Resetting an Error Message}

A "Fault Reset" resets an error message.
In the event of a "Quick Stop" triggered by a detected error of class 1 (operating state 7 Quick Stop Active), a "Fault Reset" causes a direct transition to operating state 6 Operation Enabled.

State Transitions
State transitions are triggered by an input signal, a fieldbus command or as a response to a monitoring function.
\begin{tabular}{|c|c|c|c|}
\hline State transition & Operating state & Condition / event \({ }^{(1)}\) & Response \\
\hline T0 & 1-> 2 & - Device electronics successfully initialized & \\
\hline T1 & 2-> 3 & - Parameter successfully initialized & \\
\hline T2 & 3 -> 4 & - No undervoltage Encoder successfully checked Actual velocity: <1000 rpm STO signals \(=+24 \mathrm{~V}\) & \\
\hline T3 & 4 -> 5 & - Request for enabling the power stage & \\
\hline T4 & \(5->6\) & - Automatic transition & \begin{tabular}{l}
Power stage is enabled. \\
User parameters are checked. Holding brake is released (if available).
\end{tabular} \\
\hline T7 & 4 -> 3 & \begin{tabular}{l}
- Undervoltage \\
- STO signals \(=0 \mathrm{~V}\) \\
- Actual velocity: >1000 rpm (for example by external driving force)
\end{tabular} & - \\
\hline T9 & 6 -> 3 & - Request for disabling the power stage & Movement is canceled with "Halt" or power stage is immediately disabled. Can be set via parameter DSM_ShutDownOption. \\
\hline \multicolumn{4}{|l|}{(1) In order to trigger a state transition it is sufficient if one condition is met} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l|l|}

\section*{Indication of the Operating State via Signal Outputs}

Information on the operating state is available via the signal outputs. The table below provides an overview:
\begin{tabular}{|l|l|l|}
\hline Operating state & Signal output function "No fault"(1) & Signal output function "Active"(2) \\
\hline 1 Start & 0 & 0 \\
\hline 2 Not Ready To Switch On & 0 & 0 \\
\hline 3 Switch On Disabled & 0 & 0 \\
\hline 4 Ready To Switch On & 1 & 0 \\
\hline 5 Switched On & 1 & 0 \\
\hline 6 Operation Enabled & 1 & 1 \\
\hline 7 Quick Stop Active & 0 & 0 \\
\hline 8 Fault Reaction Active & 0 & 0 \\
\hline 9 Fault & 0 & 0 \\
\hline \begin{tabular}{l} 
(1) The signal output function is factory setting for DQO \\
(2) The signal output function is the factory setting for \(\mathrm{DQ1}\)
\end{tabular} & \\
\hline
\end{tabular}

\section*{Indication of the Operating State via Fieldbus}

In the process data channel, status information is transmitted via the input data of the IO device. The operating state is indicated with the word "driveStat".
driveStat
\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline 15 & 14 & 13 & 12 & 11 & 10 & 9 & 8 \\
\hline X_ERR & X_END & X_ADD1 & - & - & QS & RF & HALT \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline 7 & 6 & 5 & 4 & 3 & 2 & 1 & 0 \\
\hline WARN & ERROR & - & - & STATE & STATE & STATE & STATE \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l|}
\hline bit & Name & Meaning \\
\hline \(0 \ldots 3\) & STATE & \begin{tabular}{l} 
Operating state (binary coded) \\
1 Start \\
2 Not Ready To Switch On \\
3 Switch On Disabled \\
4 Ready To Switch On \\
5 Switched On \\
6 Operation Enabled \\
7 Quick Stop Active \\
8 Fault Reaction Active \\
9 Fault
\end{tabular} \\
\hline \(4 \ldots 5\) & - & Reserved \\
\hline 6 & ERROR & Error detected (error classes 1 ... 3)
\end{tabular}

\section*{Changing the Operating State via Signal Inputs}

It is possible to switch between operating states via the signal inputs.
- Signal input function "Enable"
- Signal input function "Fault Reset"
- Signal input functions "Jog Positive With Enable"
- Signal input functions "Jog Negative With Enable"

Signal Input Function "Enable"
The power stage is enabled by means of the signal input function "Enable".
\begin{tabular}{|l|l|}
\hline "Enable" & State transition \\
\hline Rising edge & Enable power stage (T3) \\
\hline Falling edge & Disabling the power stage (T9 and T12) \\
\hline
\end{tabular}

In order to enable the power stage via the signal input, you must first parameterize the signal input function "Enable", see chapter Digital Inputs and Outputs (see page 209).

With the parameter IO_FaultResOnEnaInp, it is possible to also reset an error message with a rising or a falling edge at the signal input.
\begin{tabular}{|l|l|l|l|l|}
\hline Parameter name & Description & \begin{tabular}{l} 
Unit \\
Minimum value \\
Factory setting \\
Maximum value
\end{tabular} & \begin{tabular}{l} 
Data type \\
R/W \\
Persistent \\
Expert
\end{tabular} & \begin{tabular}{l} 
Parameter \\
address via \\
fieldbus
\end{tabular} \\
\hline \begin{tabular}{l} 
IO_- \\
FaultResOnE-- \\
naInp
\end{tabular} & \begin{tabular}{l} 
Additional 'Fault Reset' for the signal input \\
function 'Enable' \\
\(0 /\) Off: No additional 'Fault Reset' \\
\(1 /\) OnFallingEdge: Additional 'Fault Reset' \\
with falling edge \\
\(2 /\) OnRisingEdge: Additional 'Fault Reset' \\
with rising edge \\
Changed settings become active the next \\
time the power stage is enabled.
\end{tabular} & - & \begin{tabular}{l} 
UINT16
\end{tabular} & \begin{tabular}{l} 
Modbus 1384 \\
RROFINET 1384
\end{tabular} \\
\hline
\end{tabular}

Signal Input Function "Fault Reset"
The signal input function "Fault Reset" is used to reset an error message.
\begin{tabular}{|l|l|}
\hline "Fault Reset" & State transition \\
\hline Rising edge & \begin{tabular}{l} 
Resetting an error message (T15 and \\
T16)
\end{tabular} \\
\hline
\end{tabular}

In order to reset an error message via the signal input, you must first parameterize the signal input function "Fault Reset", see chapter Digital Inputs and Outputs (see page 209).

Signal Input Function "Jog Positive With Enable"
The signal input function "Jog Positive With Enable" enables the power stage, starts the operating mode Jog and triggers a movement in positive direction.
\begin{tabular}{|l|l|}
\hline "Jog Positive With Enable" & State transition \\
\hline Rising edge & \begin{tabular}{l} 
Enable power stage (T3) \\
Automatic change to the operating mode Jog and start of a movement in positive \\
direction. See chapter Operating Mode Jog (see page 250) for details and \\
parameterization.
\end{tabular} \\
\hline Falling edge & \begin{tabular}{l} 
Stopping the movement. \\
Disabling the power stage (T9 and T12)
\end{tabular} \\
\hline
\end{tabular}

Signal Input Function "Jog Negative With Enable"
The signal input function "Jog Negative With Enable" enables the power stage, starts the operating mode Jog and triggers a movement in negative direction.
\begin{tabular}{|l|l|}
\hline "Jog Negative With Enable" & State transition \\
\hline Rising edge & \begin{tabular}{l} 
Enable power stage (T3) \\
Automatic change to the operating mode Jog and start of a movement in negative \\
direction. See chapter Operating Mode Jog (see page 250) for details and \\
parameterization.
\end{tabular} \\
\hline Falling edge & \begin{tabular}{l} 
Stopping the movement. \\
Disabling the power stage (T9 and T12)
\end{tabular} \\
\hline
\end{tabular}

\section*{Changing the Operating State via Fieldbus}

In the process data channel, output data is used to make settings to the IO device.
Bits \(8 \ldots 15\) of the word "dmControl" are used to set the operating state.

\begin{tabular}{|l|l|l|l|}
\hline bit & Name & Meaning & Operating state \\
\hline 8 & DS & Disabling the power stage & 6 Operation Enabled -> 4 Ready To Switch On \\
\hline 9 & EN & Enabling the power stage & 4 Ready To Switch On -> 6 Operation Enabled \\
\hline 10 & QA & Perform "Quick Stop" & 6 Operation Enabled -> 7 Quick Stop Active \\
\hline 11 & FR & Perform "Fault Reset" & \begin{tabular}{l}
7 Quick Stop Active -> 6 Operation Enabled \\
9 Fault -> 4 Ready To Switch On
\end{tabular} \\
\hline 12 & - & Reserved & Reserved \\
\hline 13 & SH & Execute "Halt" & 6 Operation Enabled \\
\hline 14 & CH & Clear "Halt" & 6 Operation Enabled \\
\hline 15 & CU & \begin{tabular}{l} 
Resume operating mode interrupted by \\
"Halt"
\end{tabular} & 6 Operation Enabled \\
\hline
\end{tabular}

In the case of an access, the bits respond to a \(0->1\) change to trigger the corresponding function.
If a request for changing the operating state is not successful, this request is ignored. There is no error response.
Ambivalent bit combinations are treated in accordance with the following priority list (highest priority bit 8, lowest priority bit 14 and bit 15):
- Bit 8 (disable power stage) prior to bit 9 (enable power stage)
- Bit 10 ("Quick Stop") prior to bit 11 ("Fault Reset")
- Bit 13 (execute "Halt") prior to bit 14 (clear "Halt") and bit 15 (resume operating mode interrupted by "Halt")
In the case of an error of error class 2 or error class 3, a "Fault Reset" can only be performed when bit 9 (enable power stage) is no longer set.

\section*{Section 7.2 \\ Indicating, Starting and Changing an Operating Mode}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Indicating an Operating Mode & 248 \\
\hline Starting and Changing an Operating Mode & 249 \\
\hline
\end{tabular}

\section*{Indicating an Operating Mode}

In the process data channel, status information is transmitted via the input data of the IO device.
The word "mfStat" is used to indicate the set operating mode.

\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline 7 & 6 & 5 & 4 & 3 & 2 & 1 & 0 \\
\hline MT & ME & DE & MODE & MODE & MODE & MODE & MODE \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline bit & Name & Description \\
\hline 0 ... 4 & MODE & Indicates the set operating mode Value \(01_{h}\) : Profile Position Value \(03_{h}\) : Profile Velocity Value 04h: Profile Torque Value \(06_{\mathrm{h}}\) : Homing Value \(1 F_{h}\) : Jog \\
\hline 5 & DE & The "DE" bit relates to parameters that are independent of "Mode Toggle" (MT). The "DE" bit is set if a data value in the process data channel is invalid. \\
\hline 6 & ME & The "ME" bit relates to parameters that are dependent on "Mode Toggle" (MT). The "ME" bit is set if a request (for example, starting an operating mode) was rejected. \\
\hline 7 & MT & Handshake via "Mode Toggle" \\
\hline 8 ... 9 & CAP1 & Bit 0 and bit 1 of parameter _Cap1Count \\
\hline \(10 . . .11\) & CAP2 & Bit 0 and bit 1 of parameter _Cap2Count \\
\hline \(12 \ldots 15\) & - & Reserved \\
\hline
\end{tabular}

\section*{Starting and Changing an Operating Mode}

In the process data channel, output data is used to make settings to the IO device.
Bits \(0 \ldots 7\) in the word "dmControl" are used to set the operating mode.

\begin{tabular}{|l|l|l|}
\hline bit & Name & Description \\
\hline \(0 \ldots 4\) & MODE & \begin{tabular}{l} 
Operating Mode \\
Value \(01_{\mathrm{h}}:\) Profile Position \\
Value \(03_{\mathrm{h}}:\) Profile Velocity \\
Value \(04_{\mathrm{h}}:\) Profile Torque \\
Value \(06_{\mathrm{h}}:\) Homing \\
Value \(1 \mathrm{~F}_{\mathrm{h}}:\) Jog
\end{tabular} \\
\hline \(5 \ldots 6\) & ACTION & Operating mode-dependent \\
\hline 7 & MT & Handshake via Mode Toggle \\
\hline
\end{tabular}

The operating modes can be changed during operation. For this purpose, the current movement must be completed or explicitly canceled. The motor must be at a standstill.
The IO controller must enter the following values to activate an operating mode or to change target values:
- Target values, depending on required operating mode
- Operating mode in "dmControl", bits 0 ... 4 (MODE).
- Action for this operating mode in bit 5 and bit 6 (ACTION)
- Toggle bit 7 (MT)

The following chapters describe the possible operating modes, functions and the corresponding target values.

\section*{Section 7.3}

\section*{Operating Mode Jog}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Overview & 251 \\
\hline Parameterization & 254 \\
\hline Additional Settings & 257 \\
\hline
\end{tabular}

\section*{Overview}

Description
In the operating mode Jog, a movement is made from the actual motor position in the specified direction.
A movement can be made using one of 2 methods:
- Continuous movement
- Step movement

In addition, the product features 2 parameterizable velocities.

\section*{Continuous Movement}

As long as the signal for the direction is available, a continuous movement is made in the desired direction. The illustration below provides an overview of continuous movement via the fieldbus:

The illustration below provides an overview of continuous movement via the signal inputs:

1 Slow movement in positive direction
2 Slow movement in negative direction
The signal input functions "Jog Positive With Enable" and/or "Jog Negative With Enable" must have been parameterized, see chapter Digital Inputs and Outputs (see page 209).

Step Movement
If the signal for the direction is available for a short period of time, a movement with a parameterizable number of user-defined units is made in the desired direction.

If the signal for the direction is available continuously, a movement with a parameterizable number of userdefined units is made in the desired direction. After this movement, the motor stops for a defined period of time. Then a continuous movement is made in the desired direction.
The illustration below provides an overview of step movement via the fieldbus:

1 Slow movement in positive direction with a parameterizable number of user-defined units JoGstep
2 Waiting time JOGt ime
3 Slow continuous movement in positive direction
4 Fast continuous movement in positive direction
The illustration below provides an overview of step movement via the signal inputs:

1 Slow movement in positive direction with a parameterizable number of user-defined units JoGstep
2 Waiting time JoGtime
3 Slow continuous movement in positive direction
The signal input functions "Jog Positive With Enable" and/or "Jog Negative With Enable" must have been parameterized, see chapter Digital Inputs and Outputs (see page 209).

\section*{Starting the Operating Mode}

The operating mode can be started via the fieldbus or via the signal inputs.
The operating mode is set and started in the process data channel with the output data.
\begin{tabular}{|l|l|l|}
\hline \begin{tabular}{l} 
dmControl \\
Bits \(0 \ldots 6\) \\
MODE+ACTION
\end{tabular} & RefA32 & RefB32 \\
\hline \(1 \mathrm{~F}_{\mathrm{h}}\) & \begin{tabular}{l} 
Value 0: No movement \\
Value 1: Slow movement in positive direction \\
Value 2: Slow movement in negative direction \\
Value 5: Fast movement in positive direction \\
Value 6: Fast movement in negative direction
\end{tabular} & - \\
\hline
\end{tabular}

If the operating mode is started via the signal inputs, the signal input functions "Jog Positive With Enable" and "Jog Negative With Enable" must have been parameterized, see chapter Digital Inputs and Outputs (see page 209).
\begin{tabular}{|l|l|}
\hline Signal input function & Meaning \\
\hline "Jog Positive With Enable" & \begin{tabular}{l} 
The signal input function "Jog Positive With Enable" enables the power stage, \\
starts the operating mode Jog and triggers a movement in positive direction.
\end{tabular} \\
\hline "Jog Negative With Enable" & \begin{tabular}{l} 
The signal input function "Jog Negative With Enable" enables the power stage, \\
starts the operating mode Jog and triggers a movement in negative direction.
\end{tabular} \\
\hline
\end{tabular}

Status Information
The word "driveStat" provides information on the operating mode.
\begin{tabular}{|l|l|l|}
\hline bit & Name & Meaning \\
\hline 13 & X_ADD1 & Reserved \\
\hline 14 & X_END & \begin{tabular}{l} 
0: Operating mode started \\
1: Operating mode terminated
\end{tabular} \\
\hline 15 & X_ERR & \begin{tabular}{l} 
0: No error detected \\
1: Error detected
\end{tabular} \\
\hline
\end{tabular}

\section*{Terminating the Operating Mode}

The operating mode is terminated when the motor is at a standstill and one of the following conditions is met:
- Value 0 RefA
- Stop caused by "Halt" or "Quick Stop"
- Stop caused by a detected error

\section*{Parameterization}

\section*{Overview}

The illustration below provides an overview of the adjustable parameters for movements via the fieldbus:

The illustration below provides an overview of the adjustable parameters for movements via the signal inputs:

\section*{Velocities}

Two parameterizable velocities are available.
- Set the desired values with the parameters JOGv_slow and JOGv_fast.
\begin{tabular}{|l|l|l|l|l|}

Changing the Motion Profile for the Velocity
It is possible to change the parameterization of the Motion Profile for the Velocity (see page 289).

\section*{Additional Settings}

The following functions can be used for target value processing:
- Chapter Jerk Limitation (see page 291)
- Chapter Stop Movement with Halt (see page 292)
- Chapter Stop Movement with Quick Stop (see page 294)
- Chapter Limitation of the Velocity via Signal Inputs (see page 296)
- Chapter Limitation of the Current via Signal Inputs (see page 297)
- Chapter Setting a Signal Output via Parameter (see page 299)
- Chapter Position Capture via Signal Input (see page 301)
- Chapter Relative Movement After Capture (RMAC) (see page 304)

The following functions can be used for monitoring the movement:
- Chapter Limit Switches (see page 310)
- Chapter Software Limit Switches (see page 312)
- Chapter Load-Dependent Position Deviation (Following Error) (see page 314)
- Chapter Motor Standstill and Direction of Movement (see page 319)
- Chapter Standstill Window (see page 322)

This function is only available for a step movement.
- Chapter Position Register (see page 324)
- Chapter Position Deviation Window (see page 329)
- Chapter Velocity Deviation Window (see page 331)
- Chapter Velocity Threshold Value (see page 333)
- Chapter Current Threshold Value (see page 335)

\section*{Section 7.4}

\section*{Operating Mode Profile Torque}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Overview & 259 \\
\hline Parameterization & 260 \\
\hline Additional Settings & 262 \\
\hline
\end{tabular}

\section*{Overview}

Description
In the operating mode Profile Torque, a movement is made with a specified target torque.
Without a proper limit value, the motor can reach an unintentionally high velocity in this operating mode.
\begin{tabular}{|l|}
\hline \multicolumn{1}{|c|}{ UWARNING } \\
\hline UNINTENTIONALLY HIGH VELOCITY \\
Verify that the parameterized velocity limitation is appropriate for the motor. \\
Failure to follow these instructions can result in death, serious injury, or equipment damage. \\
\hline
\end{tabular}

Starting the Operating Mode
The operating mode is set and started in the process data channel with the output data.
\begin{tabular}{|l|l|l|}

\section*{Section 7.6 \\ Operating Mode Profile Position}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Overview & 268 \\
\hline Parameterization & 269 \\
\hline Additional Settings & 271 \\
\hline
\end{tabular}

\section*{Overview}

\section*{Description}

In the operating mode Profile Position, a movement to a desired target position is performed.
A movement can be made using one of 2 methods:
- Relative movement
- Absolute movement

\section*{Relative Movement}

In the case of a relative movement, the movement is relative with reference to the previous target position or the actual position of the motor.

\section*{Absolute Movement}

In the case of an absolute movement, the movement is absolute with reference to the zero point.

A zero point must be defined with the operating mode Homing prior to the first absolute movement.

Starting the Operating Mode
The operating mode is set and started in the process data channel with the output data.
\begin{tabular}{|l|l|l|l|}
\hline Method & \begin{tabular}{l} 
dmControl \\
Bits 0 ...6 \\

- Chapter Setting a Signal Output via Parameter (see page 299)
- Chapter Starting a Movement via a Signal Input (see page 300)
- Chapter Position Capture via Signal Input (see page 301)
- Chapter Relative Movement After Capture (RMAC) (see page 304)

The following functions can be used for monitoring the movement:
- Chapter Limit Switches (see page 310)
- Chapter Software Limit Switches (see page 312)
- Chapter Load-Dependent Position Deviation (Following Error) (see page 314)
- Chapter Motor Standstill and Direction of Movement (see page 319)
- Chapter Standstill Window (see page 322)
- Chapter Position Register (see page 324)
- Chapter Position Deviation Window (see page 329)
- Chapter Velocity Deviation Window (see page 331)
- Chapter Velocity Threshold Value (see page 333)
- Chapter Current Threshold Value (see page 335)

\section*{Section 7.7}

\section*{Operating Mode Homing}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Overview & 273 \\
\hline Parameterization & 275 \\
\hline Reference Movement to a Limit Switch & 280 \\
\hline Reference Movement to the Reference Switch in Positive Direction & 281 \\
\hline Reference Movement to the Reference Switch in Negative Direction & 282 \\
\hline Reference Movement to the Index Pulse & 283 \\
\hline Position Setting & 284 \\
\hline Additional Settings & 285 \\
\hline
\end{tabular}

\section*{Overview}

\section*{Description}

Description In the operating mode Homing, a reference is generated between a mechanical position and the actual position of the motor.
A reference between a mechanical position and the actual position of the motor is generated by means of a reference movement or by means of position setting.
A successful reference movement or position setting homes the motor and the zero point becomes valid. The zero point is the point of reference for absolute movements in the operating mode Profile Position.

\section*{Methods}

A movement can be made using different methods:
- Reference movement to a limit switch

In the case of a reference movement to a limit switch, a movement to the negative limit switch or the positive limit switch is performed.
When the limit switch is reached, the motor is stopped and a movement is made back to the switching point of the limit switch.
From the switching point of the limit switch, a movement is made to the next index pulse of the motor or to a parameterizable distance from the switching point.
The position of the index pulse or the position of the parameterizable distance from the switching point is the reference point.
- Reference movement to the reference switch

In the case of a reference movement to the reference switch, a movement to the reference switch is performed.
When the reference switch is reached, the motor is stopped and a movement is made back to the switching point of the reference switch.
From the switching point of the reference switch, a movement is made to the next index pulse of the motor or to a parameterizable distance from the switching point.
The position of the index pulse or the position of the parameterizable distance from the switching point is the reference point.
- Reference movement to the index pulse

In the case of a reference movement to the index pulse, a movement is made from the actual position to the next index pulse. The position of the index pulse is the reference point.
- Position setting

In the case of position setting, the actual position of the motor is set to a desired position value.
A reference movement must be terminated without interruption for the new zero point to be valid. If the reference movement is interrupted, it must be started again.
Motors with multiturn encoder deliver a valid zero point after they are powered on.

\section*{Starting the Operating Mode}

The operating mode is set and started in the process data channel with the output data.
\begin{tabular}{|l|l|l|l|}
\hline Method & \begin{tabular}{l} 
dmControl \\
Bits 0 ... 6 \\
MODE+ACTION
\end{tabular} & RefA32 & RefB32 \\
\hline Position setting & \(06_{\mathrm{h}}\) & - & As HMp_setP \\
\hline Reference movement & \(26_{\mathrm{h}}\) & As HMmethod & - \\
\hline
\end{tabular}

Status Information
The word "driveStat" provides information on the operating mode.
\begin{tabular}{|l|l|l|}
\hline bit & Name & Meaning \\
\hline 13 & X_ADD1 & Reserved \\
\hline 14 & X_END & \begin{tabular}{l}

0: No error detected \\
1: Error detected
\end{tabular} \\
\hline
\end{tabular}

Terminating the Operating Mode
The operating mode is terminated when the motor is at a standstill and one of the following conditions is met:
- Homing successful
- Stop caused by "Halt" or "Quick Stop"
- Stop caused by a detected error

\section*{Parameterization}

\section*{Overview}

The illustration below provides an overview of the adjustable parameters.
Overview of adjustable parameters
\begin{tabular}{|c|c|c|c|}
\hline \multicolumn{4}{|c|}{ HMmethod } \\
\hline\(=1,2,7 \ldots 14\) & \(=17,18,23 \ldots 30\) & \(=33,34\) & \(=35\) \\
\hline
\end{tabular}

Setting Limit Switches and Reference Switches
The limit switches and reference switches must be set to meet the requirements, see chapter Limit Switches (see page 310) and chapter Reference Switch (see page 311).

Selection of the Method
The operating mode Homing establishes an absolute position reference between the motor position and a defined axis position. There are various Homing methods which can be selected via the parameter HMmethod.

The HMpre fmethod parameter is used to save the preferred method to the EEPROM (persistent). When the preferred method has been set in this parameter, the method is performed during homing even after the device is powered off and on. The value to be entered corresponds to the value in the HMmethod parameter.

\section*{Setting the Distance From the Switching Point}

A distance to the switching point of the limit switch or the reference switch must be parameterized for a reference movement with index pulse. The parameter HMdis lets you set the distance to the switching limit switch or the reference switch.
\begin{tabular}{|l|l|l|l|l|}

\section*{Defining the Zero Point}

The parameter HMp_home is used to specify a desired position value, which is set at the reference point after a successful reference movement. The desired position value at the reference point defines the zero point.
If the value 0 is used, the zero point corresponds to the reference point.

\section*{Reading out the Position Distance}

The position distance between the switching point and index pulse can be read out with the following parameters.

The distance between the switching point and the index pulse must be \(>0.05\) revolutions for reproducible reference movements with index pulse.
If the index pulse is too close to the switching point, the limit switch or reference switch can be moved mechanically.
Otherwise the position of the index pulse can be moved with the parameter EnC_pabsusr, see Chapter Setting Parameters for Encoder (see page 162).

Type A
Method 11: Movement to the index pulse.
Method 27: Movement to distance from switching point.

Type B
Method 12: Movement to the index pulse.
Method 28: Movement to distance from switching point.

Type C
Method 13: Movement to the index pulse.
Method 29: Movement to distance from switching point.

Type D
Method 14: Movement to the index pulse.
Method 30: Movement to distance from switching point.

\section*{Reference Movement to the Index Pulse}

The illustration below shows a reference movement to the index pulse
Reference movement to the index pulse

1 Movement to index pulse at velocity HMv _out

\section*{Position Setting}

\section*{Description}

By means of position setting, the actual position of the motor is set to the position value in parameter HMp_setP. This also defines the zero point.
Position setting is only possible when the motor is at a standstill. Any active position deviation remains active and can still be compensated for by the position controller after position setting.

Setting the Position for Position Setting
\(\left.\begin{array}{|l|l|l|l|l|}\hline \text { Parameter name } & \text { Description } & \begin{array}{l}\text { Unit } \\ \text { Minimum value } \\ \text { Factory setting } \\ \text { Maximum value }\end{array} & \begin{array}{l}\text { Data type } \\ \text { R/W } \\ \text { Persistent } \\ \text { Expert }\end{array} & \begin{array}{l}\text { Parameter } \\ \text { address via } \\ \text { fieldbus }\end{array} \\ \hline \text { HMp_setP } & \begin{array}{l}\text { Position for Position Setting } \\ \text { Position for operating mode Homing, } \\ \text { method 35. } \\ \text { Changed settings become active } \\ \text { immediately. }\end{array} & \begin{array}{l}\text { usr_p }\end{array} & \begin{array}{l}\text { INT32 }\end{array} & \begin{array}{l}\text { Modbus 6956 } \\ \text { R/W }\end{array} \\ \text { PROFINET 6956 }\end{array}\right\}\)

Example
Movement by 4000 user-defined units with position setting

1 The motor is positioned by 2000 user-defined units.
2 By means of position setting to 0 , the actual position of the motor is set to position value 0 which, at the same time, defines a new zero point.
3 When a new movement by 2000 user-defined units is triggered, the new target position is 2000 user-defined units.

\section*{Additional Settings}

The following functions can be used for target value processing:
- Chapter Jerk Limitation (see page 291)
- Chapter Stop Movement with Halt (see page 292)
- Chapter Limitation of the Current via Signal Inputs (see page 297)
- Chapter Setting a Signal Output via Parameter (see page 299)
- Chapter Position Capture via Signal Input (see page 301)

The following functions can be used for monitoring the movement:
- Chapter Limit Switches (see page 310)
- Chapter Reference Switch (see page 311)
- Chapter Software Limit Switches (see page 312)
- Chapter Load-Dependent Position Deviation (Following Error) (see page 314)
- Chapter Motor Standstill and Direction of Movement (see page 319)
- Chapter Position Deviation Window (see page 329)
- Chapter Velocity Deviation Window (see page 331)
- Chapter Velocity Threshold Value (see page 333)
- Chapter Current Threshold Value (see page 335)

\section*{Chapter 8}

\hline
\end{tabular}

\section*{Motion Profile for the Velocity}

Target position and target velocity are input values specified by the user. A motion profile for the velocity is calculated on the basis of these input values.
The motion profile for the velocity consists of an acceleration, a deceleration and a maximum velocity.
A linear ramp for both directions of movement is available.

\section*{Availability}

The availability of the motion profile for the velocity depends on the operating mode.
In the following operating modes, the motion profile for the velocity is permanently active:
- Jog
- Profile Position
- Homing

Ramp Slope
The ramp slope determines the velocity changes of the motor per time unit. The ramp slope can be set for acceleration and deceleration.

\begin{tabular}{|c|c|c|c|c|}

\section*{Jerk Limitation}

Description
Jerk limitation smoothes sudden acceleration changes to allow for smooth transitions with almost no jerking.

Availability
Jerk limitation is available in the following operating modes.
- Jog
- Profile Position
- Homing

Settings
Jerk limitation is activated and set via the parameter RAMP_v_jerk.
\begin{tabular}{|c|c|c|c|c|}

\section*{Stop Movement with Halt}

With a Halt, the ongoing movement is interrupted; it can be resumed.
A Halt can be triggered via a digital signal input or a fieldbus command.
In order to interrupt a movement via a signal input, you must first parameterize the signal input function "Halt", see chapter Digital Inputs and Outputs (see page 209).

The movement can be interrupted with 2 different deceleration types.
- Deceleration via deceleration ramp
- Deceleration via torque ramp

Setting the Type of Deceleration
The parameter LIM_HaltReaction lets you set the type of deceleration.
\begin{tabular}{|l|l|l|l|l|}
\hline Parameter name & Description & \begin{tabular}{l} 
Unit \\

\end{tabular} & & - & \\
\hline
\end{tabular}

\section*{Setting the Deceleration Ramp}

The deceleration ramp is set with the parameter Ramp_v_dec via the Motion Profile for the Velocity (see page 289).

Setting the Torque Ramp
The parameter LIM_I_maxHalt lets you set the torque ramp.
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}
Unit \\

\hline LIM_I_maxHalt & \begin{tabular}{l}
Current for Halt \\
This value is only limited by the minimum/maximum value range (no limitation of this value by motor/power stage). \\
In the case of a Halt, the current limit (_lmax_act) is one of the following values (whichever is lowest): \\
- LIM_I_maxHalt \\
- _M_I_max \\
- _PS_I_max \\
Further current limitations caused by 12 t monitoring are also taken into account during a Halt. \\
Default: _PS_I_max at 8 kHz PWM frequency and 230/480 V mains voltage In increments of \(0.01 \mathrm{~A}_{\text {rms }}\). \\
Changed settings become active immediately.
\end{tabular} & \[
\mathrm{A}_{\mathrm{rms}}
\] & UINT16 R/W per. & Modbus 4380 PROFINET 4380 \\
\hline
\end{tabular}

\section*{Stop Movement with Quick Stop}

With a Quick Stop, the ongoing movement is stopped.
A Quick Stop can be triggered by a detected error of error classes 1 or 2 or via a fieldbus command.
The movement can be stopped with 2 different deceleration types.
- Deceleration via deceleration ramp
- Deceleration via torque ramp

In addition, you can set the operating state to switch to after the deceleration.
- Transition to operating state 9 Fault
- Transition to operating state 7 Quick Stop Active

\section*{Setting the Type of Deceleration}

The parameter LIM_QStopReact lets you set the type of deceleration.
\begin{tabular}{|c|c|c|c|c|}

\hline
\end{tabular}

\section*{Limitation of the Velocity via Signal Inputs}

Limitation via Digital Signal Input
The velocity can be limited to a specific value via a digital signal input.
The parameter IO_v_limit lets you set the velocity limitation.
\begin{tabular}{|l|l|l|l|l|}
\hline Parameter name & Description & \begin{tabular}{l} 
Unit \\

\end{tabular}

In order to limit the current via a digital signal input, you must first parameterize the signal input function "Current Limitation", see chapter Digital Inputs and Outputs (see page 209).

\section*{Zero Clamp}

\section*{Description}

The motor can be stopped via a digital signal input. The velocity of the motor must be below a parameterizable velocity value.

Availability
The signal input function "Zero Clamp" is available in the following operating mode:
- Profile Velocity

Settings
Target velocities below the parameterized velocity value are interpreted as "zero".
The signal input function "Zero Clamp" has a hysteresis of \(20 \%\).
The parameter MON_v_zeroclamp lets you set the velocity value.
\begin{tabular}{|l|l|l|l|l|}
\hline Parameter name & Description & \begin{tabular}{l}

\end{tabular} \\
\hline
\end{tabular}

In order to stop the motor via a digital signal input, you must first parameterize the signal input function "Zero Clamp", see chapter Digital Inputs and Outputs (see page 209).

\section*{Setting a Signal Output via Parameter}

Description
The digital signal outputs can be set as required via the fieldbus.
In order to set a digital signal output via the parameter, you must first parameterize the signal output function "Freely Available", see chapter Parameterization of the Signal Output Functions (see page 215).

The parameter IO_DQ_set lets you set the digital signal outputs.
\(\left.\begin{array}{|l|l|l|l|l|}\hline \text { Parameter name } & \text { Description } & \begin{array}{l}\text { Unit } \\
\text { Minimum value } \\
\text { Factory setting } \\
\text { Maximum value }\end{array} & \begin{array}{l}\text { Data type } \\
\text { R/W } \\
\text { Persistent } \\
\text { Expert }\end{array} & \begin{array}{l}\text { Parameter } \\
\text { address via } \\
\text { fieldbus }\end{array} \\
\hline \text { IO_DQ_set } & \begin{array}{l}\text { Setting the digital outputs directly } \\
\text { Digital outputs can only be set directly if the } \\
\text { signal output function has been set to } \\
\text { 'Available as required'. }\end{array} & - & - & \begin{array}{l}\text { UINT16 } \\
\text { R/W }\end{array} \\
\begin{array}{ll}\text { Bit assignments: } \\
\text { Bit 0: DQ0 } \\
\text { Bit 1: DQ1 }\end{array} & - & - & \text { Modbus 2082 } \\
\text { PROFINET 2082 }\end{array}\right]\)\begin{tabular}{l} 
\\
\hline
\end{tabular}

If the IO controller is in the state STOP or in the case of a communication interruption between the IO controller and the drive, the states of the signal outputs of the drive remain as they have been set. The states of the signal outputs of the drive cannot be modified as long as the IO controller is in the state STOP.

\section*{Starting a Movement via a Signal Input}

The signal input function "Start Profile Positioning" sets the start signal for the movement in the operating mode Profile Position. The positioning movement is then executed when the edge at the digital input rises

\section*{Position Capture via Signal Input}

\section*{Description}

The motor position can be captured when a signal is detected at a Capture input.

\section*{Number of Capture Inputs}

2 Capture inputs are available.
- DI0/CAP1 and DI1/CAP2

\section*{Selection of the Method}

The motor position can be captured in 2 different ways:
- One-time position capture

One-time capture means that the position is captured at the first edge.
- Continuous motor position capture

Continuous capture means that the motor position is captured anew at every edge. The previously captured value is lost.
The motor position can be captured when the edge at the Capture input rises or falls.

\section*{Accuracy}

A jitter of \(2 \mu \mathrm{~s}\) results in an inaccuracy of the captured position of approximately 1.6 user-defined units at a velocity of \(3000 \mathrm{~min}^{-1}\).
\(\left(3000 \mathrm{~min}^{-1}=(3000 * 16384) /\left(60 * 10^{6}\right)=0.8\right.\) usr_p/ \(\mu \mathrm{s}\) )
If the factory settings for scaling are used, 1.6 user-defined units correspond to \(0.036^{\circ}\).
The captured motor position is less accurate during the acceleration phase and the deceleration phase.

Status Messages
The parameter _CapStatus indicates the capture status.
\begin{tabular}{|l|l|l|l|l|}
\hline Parameter name & Description & \begin{tabular}{l} 
Unit \\

\section*{Relative Movement After Capture (RMAC)}

\section*{Description}

Relative Movement After Capture (RMAC) starts a relative movement via a signal input while another movement is running
The target position and the velocity can be parameterized.

1 Movement with set operating mode (for example operating mode Profile Velocity)
2 Start of the relative movement after capture with the signal input function Start Signal Of RMAC
3a Relative movement after capture is performed with unchanged velocity
3b Relative movement after capture is performed with parameterized velocity
4 Target position reached

\section*{Availability}

A Relative Movement After Capture (RMAC) can be started in the following operating modes:
- Jog
- Profile Torque
- Profile Velocity
- Profile Position

Signal Input Functions
The signal input function "Start Signal Of RMAC" is required to start the relative movement.
The signal input function must have been parameterized, see chapter Digital Inputs and Outputs (see page 209).

Status Indication
The status is available via a signal output or via the fieldbus.
In order to read the status via a signal output, you must first parameterize the signal output function "RMAC Active Or Finished", see chapter Digital Inputs and Outputs (see page 209).
In order to read the status via the fieldbus, you must set the status bits of the status parameters, see chapter Adjustable Bits of the Status Parameters (see page 337).
In addition, the status is available via the parameters _RMAC_Status and _RMAC_DetailStatus.
\begin{tabular}{|c|c|c|c|c|}

\end{tabular}

\section*{Activates Relative Movement After Capture}

Relative Movement After Capture (RMAC) must be activated before it can be started.
Relative Movement After Capture (RMAC) is activated via the following parameter:
\begin{tabular}{|l|l|l|l|l|}
\hline Parameter name & Description & \begin{tabular}{l} 
Unit \\
Minimum value \\
Factory setting \\
Maximum value
\end{tabular} & \begin{tabular}{l}

\section*{Backlash Compensation}

By setting backlash compensation, you can compensate for mechanical backlash.
Example of mechanical backlash

1 Example of low mechanical backlash
2 Example of high mechanical backlash
When backlash compensation is activated, the drive automatically compensates for the mechanical backlash during each movement.

\section*{Availability}

Backlash compensation is possible in the following operating modes:
- Jog
- Profile Position
- Homing

Parameterization
To use backlash compensation, you must set the amount of backlash.
The parameter BLSH_Position lets you set the amount of backlash in user-defined units.
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}
Unit \\

\end{tabular}

\section*{Activating Backlash Compensation}

Before you can activate backlash compensation, there must be a movement in positive or negative direction. Backlash compensation is activated with the parameter BLSH_Mode.
- Start a movement in positive direction or in negative direction. This movement must last as long as it takes to move the mechanical system connected to the motor.
- If the movement was in positive direction (positive target values), activate backlash compensation with the value "OnAfterPositiveMovement".
- If the movement was in negative direction (negative target values), activate backlash compensation with the value "OnAfterNegativeMovement".
\begin{tabular}{|l|l|l|l|l|}

\section*{Section 8.2}

Functions for Monitoring Movements

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Limit Switches & 310 \\
\hline Reference Switch & 311 \\
\hline Software Limit Switches & 312 \\
\hline Load-Dependent Position Deviation (Following Error) & 314 \\
\hline Load-Dependent Velocity Deviation & 317 \\
\hline Motor Standstill and Direction of Movement & 319 \\
\hline Torque Window & 320 \\
\hline Velocity Window & 321 \\
\hline Standstill Window & 322 \\
\hline Position Register & 324 \\
\hline Position Deviation Window & 329 \\
\hline Velocity Deviation Window & 331 \\
\hline Velocity Threshold Value & 333 \\
\hline Current Threshold Value & 335 \\
\hline Adjustable Bits of the Status Parameters & 337 \\
\hline
\end{tabular}

Limit Switches

The use of limit switches can provide some protection against hazards (for example, collision with mechanical stop caused by incorrect reference values)

\section*{A WARNING}

\section*{LOSS OF CONTROL}
- Ensure that limit switches are installed as determined by your risk assessment.
- Verify correct connection of the limit switches.
- Verify that the limit switches are sufficiently distant from the mechanical stop to allow an adequate stopping distance.
- Verify correct parameterization and function of the limit switches.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Limit Switches
Movements can be monitored using limit switches. A positive limit switch and a negative limit switch can be used for monitoring.

If the positive or negative limit switch are tripped, the movement stops. An error message is generated and the operating state switches to 7 Quick Stop Active.

The error message can be reset by means of a "Fault Reset". The operating state switches back to 6 Operation Enabled.

The movement can continue, however, only in the opposite direction. For example, if the positive limit switch was triggered, further movement is only possible in negative direction. In the case of further movement in positive direction, a new error message is generated and the operating state switches back to 7 Quick Stop Active.
The parameters IOsigLIMP and IOsigLIMN are used to set the type of limit switch.
\begin{tabular}{|c|c|c|c|c|}

per.
\end{tabular} \\
\hline
\end{tabular}

The signal input function "Reference Switch (REF)" must have been parameterized, see chapter Digital Inputs and Outputs (see page 209).

\section*{Software Limit Switches}

\section*{Description}

Movements can be monitored using software limit switches. A positive position limit and a negative position limit can be set for monitoring.
If the positive or negative position limit switch are reached, the movement stops. An error message is generated and the operating state switches to 7 Quick Stop Active.
The error message can be reset by means of a "Fault Reset". The operating state switches back to 6 Operation Enabled.
The movement can continue, however, only in the opposite direction of the position limit. For example, if the positive position limit was reached, further movement is only possible in negative direction. In the case of further movement in positive direction, a new error message is generated and the operating state switches back to 7 Quick Stop Active.

\section*{Prerequisite}

Software limit switch monitoring only works with a valid zero point, see chapter Size of the Movement Range (see page 192).

\section*{Behavior in Operating Modes with Target Positions}

In the case of operating modes with target positions, the target position is compared to the position limits before the movement is started. The movement is started normally, even if the target position is greater than the positive position limit or less than the negative position limit. However, the movement is stopped before the position limit is exceeded.
In the following operating modes, the target position is verified prior to the start of a movement.
- Jog (step movement)
- Profile Position

\section*{Behavior in Operating Modes Without Target Positions}

In operating modes without target position, a Quick Stop is triggered at the position limit.
In the following operating modes, a Quick Stop is triggered at the position limit.
- Jog (continuous movement)
- Profile Torque
- Profile Velocity

The parameter MON_SWLimMode allows you to set the behavior when a position limit is reached.
\begin{tabular}{|l|l|l|l|l|}
\hline Parameter name & Description & \begin{tabular}{l} 
Unit \\
Minimum value \\
Factory setting \\
Maximum value
\end{tabular} & \begin{tabular}{l} 
Data type \\
R/W \\
Persistent \\
Expert
\end{tabular} & \begin{tabular}{l} 
Parameter \\
address via \\
fieldbus
\end{tabular} \\
\hline MON_SWLimMode & \begin{tabular}{l} 
Behavior when position limit is reached \\
\(0 /\) Standstill Behind Position Limit: Quick \\
Stop is triggered at position limit and \\
standstill is reached behind position limit \\
\(1 /\) Standstill At Position Limit: Quick Stop is \\
triggered in front of position limit and \\
standstill is reached at position limit \\
Changed settings become active \\
immediately.
\end{tabular} & - & 0 & 1 \\
0
\end{tabular}

Standstill at the position limit in operating modes without target position requires the parameter LIM_QStopReact to be set to "Deceleration ramp (Quick Stop)", see chapter Stop Movement with Quick Stop (see page 294). If the parameter LIM_QStopReact is set to "Torque ramp (Quick Stop)", the movement may come to a standstill in front of or behind the position limit due to different loads.

Activation
The software limit switches are activated via the parameter MON_SW_Limits.
\begin{tabular}{|l|l|l|l|l|}

\section*{Load-Dependent Position Deviation (Following Error)}

\section*{Description}

The load-dependent position deviation is the difference between the reference position and the actual position caused by the load.
Parameters are available to read the load-dependent position deviation during operation and the maximum position deviation reached so far.
The maximum permissible load-dependent position deviation can be parameterized. In addition, you can set the error class.

\section*{Availability}

Monitoring of the load-dependent position deviation is available in the following operating modes:
- Jog
- Profile Position
- Homing

\section*{Reading the Position Deviation}

The following parameters let you read the load-dependent position deviation in user-defined units or revolutions.

\section*{Motor Standstill and Direction of Movement}

Description
The status of a movement can be monitored. You can read out whether the motor is at a standstill or whether it moves in a specific direction.
A velocity of \(<10 \mathrm{rpm}\) is interpreted as standstill.

The status is available via signal outputs. In order to read the status, you must first parameterize the signal output functions "Motor Standstill", "Motor Moves Positive" or "Motor Moves Negative", see chapter Digital Inputs and Outputs (see page 209).

\section*{Torque Window}

\section*{Description}

The torque window allows you to monitor whether the motor has reached the target torque.
If the difference between the target torque and the actual torque remains in the torque window for the time MON_tq_winTime, the target torque is considered to have been reached.

\section*{Availability}

The torque window is available in the following operating modes
- Profile Torque

Setings

1 Target torque
2 Target torque reached (the actual torque did not exceed the permissible deviation MON_tq_win during time MON_tq winTime).

The parameters MON_tq_win and MON_tq_winTime specify the size of the window.

\section*{Standstill Window}

\section*{Description}

The standstill window allows you to monitor whether the motor has reached the target position.
If the difference between the target position and the actual position remains in the standstill window for the time MON_p_winTime, the target position is considered to have been reached.

Availability
The standstill window is available in the following operating modes.
- Jog (step movement)
- Profile Position
- Homing

Settings

1 Target position reached (the actual position did not exceed the permissible deviation MON_p_win_usr during time MON_p_winTime).

The parameters MON_p_win_usr (MON_p_win) and MON_p_winTime specify the size of the window. The parameter MON_p_winTout can be used to set the period of time after which a detected error is signaled if the standstill window was not reached.

\section*{Position Register}

\section*{Description}

The position register allows you to monitor whether the motor is within a parameterizable position range.
A movement can be monitored using one of 4 methods:
- The motor position is greater than or equal to comparison value A .
- The motor position is less than or equal to comparison value \(A\).
- The motor position is within the range between comparison value \(A\) and comparison value \(B\).
- The motor position is outside the range between comparison value \(A\) and comparison value \(B\).

Separate channels are available for monitoring.

Number of Channels
4 channels are available.

\section*{Status Messages}

The status of the position register is available via the parameter _PosRegStatus.
\begin{tabular}{|l|l|l|l|l|}
\hline Parameter name & Description & \begin{tabular}{l} 
Unit \\
Minimum value \\
Factory setting \\
Maximum value
\end{tabular} & \begin{tabular}{l}

\section*{Setting the Comparison Criterion}

The comparison criterion is set via the following parameters.
In the case of the comparison criteria "Pact in" and "Pact out", there is a difference between "basic" and "extended".
- Basic: The movement to be performed remains within the movement range.
- Extended: The movement to be performed can extend beyond the movement range.
\begin{tabular}{|l|l|l|l|l|}

\section*{Position Deviation Window}

\section*{Description}

The position deviation window allows you to monitor whether the motor is within a parameterizable position deviation.

The position deviation is the difference between reference position and actual position.
The position deviation window comprises position deviation and monitoring time.

\section*{Availability}

The position deviation window is available in the following operating modes.
- Jog
- Profile Position
- Homing

Settings

The parameters MON_p_DiffWin_usr (MON_p_DiffWin) and MON_ChkTime specify the size of the window.

Status Indication
The status is available via a signal output or via the fieldbus.
In order to read the status via a signal output, you must first parameterize the signal output function "In Position Deviation Window", see chapter Digital Inputs and Outputs (see page 209).
In order to read the status via the fieldbus, you must set the status bits of the status parameters, see chapter Adjustable Bits of the Status Parameters (see page 337).
The parameter MON_ChkTime acts on the parameters MON_p_DiffWin_usr (MON_p_DiffWin), MON_v_DiffWin, MON_v_Threshold and MON_I_Threshold.

\section*{Velocity Deviation Window}

Description
The velocity deviation window allows you to monitor whether the motor is within a parameterizable velocity deviation.

The velocity deviation is the difference between the reference velocity and the actual velocity.
The velocity deviation window comprises velocity deviation and monitoring time.

\section*{Availability}

The velocity deviation window is available in the following operating modes.
- Jog
- Profile Velocity
- Profile Position
- Homing

Settings

The parameters MON_v_DiffWin and MON_ChkTime specify the size of the window.

Status Indication
The status is available via a signal output or via the fieldbus.
In order to read the status via a signal output, you must first parameterize the signal output function "In Velocity Deviation Window", see chapter Digital Inputs and Outputs (see page 209).
In order to read the status via the fieldbus, you must set the status bits of the status parameters, see chapter Adjustable Bits of the Status Parameters (see page 337).
The parameter MON_ChkTime acts on the parameters MON_p_DiffWin_usr (MON_p_DiffWin), MON_v_DiffWin, MON_v_Threshold and MON_I_Threshold.

\section*{Velocity Threshold Value}

\section*{Description}

The velocity threshold value allows you to monitor whether the actual velocity is below a parameterizable velocity value.
The velocity threshold value comprises the velocity and the monitoring time.

\section*{Settings}

The parameters MON_v_Threshold and MON_ChkTime specify the size of the window.

Status Indication
The status is available via a signal output or via the fieldbus.
In order to read the status via a signal output, you must first parameterize the signal output function "Velocity Below Threshold", see chapter Digital Inputs and Outputs (see page 209).
In order to read the status via the fieldbus, you must set the status bits of the status parameters, see chapter Adjustable Bits of the Status Parameters (see page 337).
The parameter MON_ChkTime acts on the parameters MON_p_DiffWin_usr (MON_p_DiffWin), MON_v_DiffWin, MON_v_Threshold and MON_I_Threshold.

\section*{Current Threshold Value}

The current threshold value allows you to monitor whether the actual current is below a parameterizable current value.

The current threshold value comprises the current value and the monitoring time.

\section*{Settings}

The parameters MON_I_Threshold and MON_ChkTime specify the size of the window.

Status Indication
The status is available via a signal output or via the fieldbus.
In order to read the status via a signal output, you must first parameterize the signal output function "Current Below Threshold", see chapter Digital Inputs and Outputs (see page 209).
In order to read the status via the fieldbus, you must set the status bits of the status parameters, see chapter Adjustable Bits of the Status Parameters (see page 337).
The parameter MON_ChkTime acts on the parameters MON_p_DiffWin_usr (MON_p_DiffWin), MON_v_DiffWin, MON_v_Threshold and MON_I_Threshold.

\hline
\end{tabular}

\section*{Monitoring Load and Overload ( \(\mathrm{I}^{2} \mathrm{~T}\) Monitoring)}

Description
The load is the thermal load on the power stage, the motor and the braking resistor.
Load and overload on the individual components are monitored internally; the values can be read by means of parameters.
Overload starts at a load value of \(100 \%\).

(2)

1 Load
2 Overload

\section*{Load Monitoring}

The load can be read using the following parameters:
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}
Unit \\
Minimum value \\
Factory setting \\
Maximum value
\end{tabular} & \begin{tabular}{l}
Data type \\

\hline _RES_load & Load of braking resistor The braking resistor set via parameter RESint_ext is monitored. & \[
\%
\] & INT16 R/- & Modbus 7208 PROFINET 7208 \\
\hline
\end{tabular}

\section*{Overload Monitoring}

In the case of \(100 \%\) overload of the power stage or the motor), the current is limited internally. In the case of \(100 \%\) overload of the braking resistor, the braking resistor is deactivated.
The overload and the peak value can be read using the following parameters:
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}
Unit \\
Minimum value \\
Factory setting \\
Maximum value
\end{tabular} & \begin{tabular}{l}

\hline
\end{tabular}

\section*{Commutation Monitoring}

Commutation monitoring verifies the plausibility of acceleration and effective motor torque.
If the motor accelerates though the drive control decelerates the motor with the maximum current, an error is detected.
Deactivating commutation monitoring can cause unintended movements.
\begin{tabular}{|l|l|}
\hline \multicolumn{1}{|c|}{ WNRNING } \\
\hline UNINTENDED MOVEMENT \\
- Only deactivate commutation monitoring during commissioning and only for test purposes. \\
- Verify that the commutation monitoring is active prior to putting the equipment into service. \\
Failure to follow these instructions can result in death, serious injury, or equipment damage. \\
\hline
\end{tabular}

The parameter MON_commutat lets you deactivate commutation monitoring.
\begin{tabular}{|l|l|l|l|l|}

\end{tabular}

\section*{Monitoring of Mains Phases}

If a three-phase drive is missing a mains phase and mains phase monitoring is not correctly set, this can cause overload of the product.

\section*{NOTICE}

\section*{INOPERABLE EQUIPMENT DUE TO MISSING MAINS PHASE}
- Verify that mains phase monitoring is set to "Automatic Mains Detection" or to "Mains ..." with the correct voltage value if the drive is supplied via the mains phases.
- Verify that mains phase monitoring is set to "DC bus only ..." with the correct voltage value if the drive is supplied via the DC bus.

Failure to follow these instructions can result in equipment damage.

The parameter ErrorResp_Flt_AC lets you set the error response to a missing mains phase for threephase devices.
\begin{tabular}{|c|c|c|c|c|}

\section*{Ground Fault Monitoring}

When the power stage is enabled, the device monitors the motor phases for ground faults. A ground fault occurs when one or more motor phases are short-circuited to the ground (earth) of the application.
A ground fault of one or more motor phases is detected. A ground fault of the DC bus or the braking resistor is not detected.
If the ground fault monitoring is deactivated, the drive may be rendered inoperable by a ground fault.

\section*{NOTICE}

\section*{INOPERABLE EQUIPMENT DUE TO GROUND FAULTS}
- Only deactivate ground fault monitoring during commissioning and only for test purposes.
- Verify that the ground fault monitoring is active prior to putting the equipment into service.

Failure to follow these instructions can result in equipment damage.

\hline
\end{tabular}

Operating State LEDs

The operating state LEDs show the current operating state.

\section*{Memory Card LEDs}

The memory card LEDs show the status of the memory card.

1 LED green
2 LED red
A The parameter values stored in the device and the contents of the memory card are different. The contents of the memory card is transferred to the device.
B The memory card is empty. The configuration of the device is transferred to the memory card.
C The parameter values stored in the device and the contents of the memory card are identical.
D The memory card is write-protected.
E An error was detected during data transfer. Check the error memory of the device.
F Data on the memory card does not match the device or is damaged.
G No memory card detected. Power off the supply. Verify that the memory card has been properly inserted (contacts, slanted corner).

DC Bus LED

The DC bus LED shows the status of the DC bus.

\begin{tabular}{|l|l|}
\hline Status & Meaning \\
\hline On & Voltage at DC bus. \\
\hline Off & \begin{tabular}{l} 
Undervoltage. The DC bus LED is not an indicator of \\
the absence of DC bus voltage.
\end{tabular} \\
\hline
\end{tabular}

Observe the information provided in chapter Product Related Information (see page 14).

\section*{Section 9.2}

\section*{Diagnostics via Signal Outputs}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Indicating the Operating State & 356 \\
\hline Indicating Error Messages & 357 \\
\hline
\end{tabular}

\section*{Indicating the Operating State}

Information on the operating state is available via the signal outputs.
The table below provides an overview.
\begin{tabular}{|l|l|l|}
\hline & \multicolumn{2}{|l|}{ Signal output function } \\
\hline Operating state & "No fault"(1) & "Active"(2) \\
\hline 1 Start & 0 & 0 \\
\hline 2 Not Ready To Switch On & 0 & 0 \\
\hline 3 Switch On Disabled & 0 & 0 \\
\hline 4 Ready To Switch On & 1 & 0 \\
\hline 5 Switched On & 1 & 0 \\
\hline 6 Operation Enabled & 1 & 1 \\
\hline 7 Quick Stop Active & 0 & 0 \\
\hline 8 Fault Reaction Active & 0 & 0 \\
\hline 9 Fault & 0 & 0 \\
\hline (1) & & \\
\hline
\end{tabular}
(1) The signal output function is factory setting for signal output DQ0
(2) The signal output function is the factory setting for signal output DQ1

\section*{Indicating Error Messages}

Selected error messages can be output via the signal outputs.
In order to output an error message via a signal output, you must first parameterizes the signal output functions "Selected Warning" or "Selected Error", see chapter Digital Inputs and Outputs (see page 209).

The parameters MON_IO_SelWar1 and MON_IO_SelWar2 are used to specify error codes with the error class 0 .

The parameters MON_IO_SelErr1 and MON_IO_SelErr2 are used to specify error codes with the error classes 1 ... 4.

If an error specified in one of these parameters is detected, the corresponding signal output is to be set.
The list of the error messages sorted by error code can be found in the chapter Error Messages (see page 367 ).
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}

\section*{Section 9.3}

\section*{Diagnostics via the Fieldbus}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Fieldbus Communication Error Diagnostics & 359 \\
\hline Most Recent Detected Error - Status Bits & 360 \\
\hline Error Messages & 362 \\
\hline Most Recent Detected Error - Error Code & 364 \\
\hline Error Memory & 365 \\
\hline
\end{tabular}

\section*{Fieldbus Communication Error Diagnostics}

Checking Connections
A properly operating fieldbus is essential for evaluating status and error messages.
If the product cannot be addressed via the fieldbus, first verify the connections.
Verify the following connections:
- System power supply
- Supply connections
- Fieldbus cables and wiring
- Fieldbus connection

Fieldbus Function Test
If the connections are correct, verify that you can address the product on the fieldbus.
This can be done, for example, with the software "Primary Setup Tool (PST)".
If you can address the product, verify the settings for the IP address and the device name.

\section*{Most Recent Detected Error - Status Bits}

Error Bits
The parameters _WarnLatched and _SigLatched contain information on errors of error class 0 and errors of error classes 1 ... 4.

\section*{Error Messages}

Overview
Error messages generated during operation on network are received by the IO controller via the fieldbus. The following error messages are possible:
- Synchronous errors
- Asynchronous errors

\section*{Error Message in Parameter Channel}

If a command cannot be processed in the parameter channel, the IO controller receives a synchronous error message from the IO device.

In the case of a synchronous error message, the input data contains the following information:
\begin{tabular}{|l|l|l|l|}
\hline Ctrl & Subindex & Index & PV \\
\hline \(70_{h}\) & \(00_{h}\) & Contains the address of the parameter & Contains the error number \\
\hline
\end{tabular}

\section*{Error Message in Process Data Channel}

If a command cannot be processed in the process data channel, bit 6 (ModeError, ME) in the word "mfStat" is set in the input data.
Data such as position and velocity is transmitted via the process data channel. If the data is not accepted (for example, if the value is outside of the permissible range), bit 5 (DataError, DE) is set in the input data in the word "mfStat".
\begin{tabular}{|l|l|l|}
\hline Bit & Name & Description \\
\hline 5 & DE & \begin{tabular}{l} 
The DataError bit relates to parameters that are independent of "Mode Toggle" (MT). It \\
is set if a data value in the process data channel is invalid.
\end{tabular} \\
\hline 6 & ME & \begin{tabular}{l} 
The ModeError bit relates to parameters that are dependent on "Mode Toggle" (MT). Is \\
set if a request from a IO controller (starting an operating mode) was rejected
\end{tabular} \\
\hline
\end{tabular}

If \(D E\) or \(M E\) are set, this does not interrupt the ongoing movement. To determine the cause of the error, the IO controller can read the error number from the parameters _DataError, 6966:00 and _ModeError, 6962:00.

In order to identify the parameter that has caused the DE bit or the ME bit to be set, the position of the parameter can be read from the parameters _DataErrorInfo, 6970:00 and _ModeErrorInfo, 6968:00.

ModeErrorinfo 2
DataErrorInfo 1
ModeErrorinfo 1

Overview for "Drive Profile Lexium 2"

The error message is reset when the next valid data frame is transmitted.

\section*{Asynchronous Errors}

Asynchronous errors are triggered by internal monitoring functions (for example, temperature) or by external monitoring functions (for example, limit switch).

Asynchronous errors are indicated in the following way:
- Transition to operating state 7 Quick Stop Active or to operating state 9 Fault (see "driveStat", bits \(0 . . .3\) )
- Setting of:
- "driveStat" bit 6 (error of error classes 1 ... 4)
o "driveStat" bit 7 (error of error class 0 )
o "driveStat", bit 15 (operating mode terminated with detected error).
The error bits have the following meaning:
- Bit 6

Error of error classes 1 ... 4
The cause is contained in parameter _LastError in a bit-coded way.
- Bit 7

Error of error class 0
The error information is contained in parameter _LastWarning in a bit-coded way.
- Bit 15

Indicates whether the operating mode was terminated by an error.

Error Message via "Diagnostics Alarm"
If an error of error classes \(1 \ldots 4\) is detected, the IO device sends a "Diagnostics Alarm" to the IO controller.
Error message via "Diagnostics Alarm"

Error bit

\section*{Most Recent Detected Error - Error Code}

If the master controller receives information concerning a detected error via the process data communication, the following parameters can be used to read the error code.
The list of the error messages sorted by error code can be found in the chapter Error Messages (see page 367).

\section*{Most Recent Detected Error with Error Class 0}

The parameter _LastWarning allows you to read the error number of the last detected error with error class 0 .
\begin{tabular}{|l|l|l|l|l|}
\hline Parameter name & Description & \begin{tabular}{l} 
Unit \\
Minimum value \\
Factory setting \\

limit switch error causes overvoltage, this \\
parameter contains the code of the \\
detected limit switch error.
\end{tabular} & \begin{tabular}{l} 
Modbus 7178 \\
PROFINET 7178
\end{tabular} \\
Exception: Detected errors of error class 4 \\
overwrite existing entries.
\end{tabular}\(\quad\)\begin{tabular}{l}
- \\
\hline
\end{tabular}

\section*{Error Memory}

General
The error memory is an error history of the last 10 error messages. It is not cleared even if the product is powered off. The error memory allows you to read and evaluate past events.
The following information on the events is stored:
- Error class
- Error code
- Motor current
- Number of power on cycles
- Additional error information (for example, parameter numbers)
- Product temperature
- Power stage temperature
- Time the error was detected (with reference to operating hours counter)
- DC Bus Voltage
- Velocity
- Number of Enable cycles after powering on
- Time from Enable until detection of the error

The stored information relates to the situation at the point in time the error was detected.
The list of the error messages sorted by error code can be found in the chapter Error Messages (see page 367 ).

\section*{Reading the Error Memory}

The error memory can only be read sequentially. The parameter ERR_reset must be used to reset the read pointer. Then the first error entry can be read. The read pointer is automatically set to the next entry. A new read access delivers the next error entry. If the error code 0 is returned, there is no additional error entry.
\begin{tabular}{|l|l|}
\hline Position of the entry & Meaning \\
\hline 1 & First error message (oldest message). \\
\hline 2 & Second error message (later message). \\
\hline\(\ldots\) & \(\ldots\) \\
\hline 10 & \begin{tabular}{l} 
Tenth error message. In the case of ten error \\
messages, the most recent error message is \\
contained here.
\end{tabular} \\
\hline
\end{tabular}

An error entry consists of several pieces of information which can be read using different parameters. When you read an error entry, the error code must be read first with the parameter _ERR_number.
The following parameters allow you to manage the error memory:
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}
Unit \\
Minimum value \\
Factory setting \\
Maximum value
\end{tabular} & \begin{tabular}{l}
Data type R/W \\
Persistent Expert
\end{tabular} & Parameter address via fieldbus \\
\hline _ERR_class & \begin{tabular}{l}
Error class \\
Value 0: Error class 0 \\
Value 1: Error class 1 \\
Value 2: Error class 2 \\
Value 3: Error class 3 \\
Value 4: Error class 4
\end{tabular} & \[
\begin{aligned}
& - \\
& 0 \\
& - \\
& 4
\end{aligned}
\] & UINT16 R/- & Modbus 15364 PROFINET 15364 \\
\hline _ERR_number & \begin{tabular}{l}
Error code \\
Reading this parameter copies the entire entry for the detected error (error class, time of detection of error, ...) to an intermediate memory from which the elements of the detected error can then be read. \\
In addition, the read pointer of the error memory is automatically set to the next error entry.
\end{tabular} & 0
\[

\section*{Section 9.4}

\section*{Error Messages}

What Is in This Section?
This section contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Description of Error Messages & 368 \\
\hline Table of Error Messages & 369 \\
\hline
\end{tabular}

\section*{Description of Error Messages}

\section*{Description}

If monitoring functions of the drive detect an error, the drive generates an error message. Each error message is identified by an error code.
The following information is available for each error message:
- Error code
- Error class
- Description of error
- Possible causes
- Possible remedies

\section*{Range of Error Messages}

The table below summarizes the error codes classified by range.
\begin{tabular}{|l|l|}
\hline Error code & Range \\
\hline E 1xxx & General \\
\hline E 2xxx & Overcurrent \\
\hline E 3xxx & Voltage \\
\hline E 4xxx & Temperature \\
\hline E 5xxx & Hardware \\
\hline E 6xxx & Software \\
\hline E 7xxx & Interface, wiring \\
\hline E 8xxx & Fieldbus \\
\hline E Axxx & Motor movement \\
\hline E Bxxx & Communication \\
\hline
\end{tabular}

\section*{Error Class of Error Messages}

The error messages are classified according to the following error classes:
\begin{tabular}{|l|l|l|l|}
\hline Error class & State transition \({ }^{1)}\) & Error response & Resetting the error message \\
\hline 0 & - & No interruption of the movement & Function "Fault Reset" \\
\hline 1 & T11 & T13, T14 & \begin{tabular}{l} 
Stop movement with "Quick Stop" \\
Stop movement with "Quick Stop" and disable \\
the power stage when the motor has come to a \\
standstill
\end{tabular} \\
\hline 2 & T13, T14 & \begin{tabular}{l} 
Disable the power stage immediately without \\
stopping the movement first
\end{tabular} & Function "Fault Reset" \\
\hline 3 & T13, T14 & \begin{tabular}{l} 
Disable the power stage immediately without \\
stopping the movement first
\end{tabular} & Power cycle \\
\hline 4 & (1) See chapter Operating State (see page 238) & \\
\hline
\end{tabular}

\section*{Table of Error Messages}

List of the Error Messages Sorted by Error Code
\begin{tabular}{|c|c|c|c|c|}
\hline Error code & Error class & Description & Cause & Correctives \\
\hline E 1100 & 0 & Parameter out of permissible value range & The value entered was outside of the permissible value range for this parameter. & The entered value must be within the permissible value range. \\
\hline E 1101 & 0 & Parameter does not exist & Error detected by parameter management: Parameter (index) does not exist. & Select a different parameter (index). \\
\hline E 1102 & 0 & Parameter does not exist & Error detected by parameter management: Parameter (subindex) does not exist. & Select a different parameter (subindex). \\
\hline E 1103 & 0 & Parameter write not permissible (READ only) & Write access to read only parameter. & Write only to parameters that are not read-only. \\
\hline E 1104 & 0 & Write access denied (no access authorization) & Parameter only accessible at expert level. & The write access level expert is required. \\
\hline E 1105 & 0 & Block Upload/Download not initialized & & \\
\hline E 1106 & 0 & Command not permissible while power stage is active & Command not permissible while the power stage is enabled (operating state Operation Enabled or Quick Stop Active). & Disable the power stage and repeat the command. \\
\hline E 1107 & 0 & Access via other interface blocked & Access occupied by another channel (for example: Commissioning software is active and fieldbus access was tried at the same time). & Verify the channel that blocks access. \\
\hline E 1108 & 0 & File cannot be uploaded: Incorrect file ID & & \\
\hline E 1109 & 1 & Data stored after a power outage is invalid & & \\
\hline E 110 A & 0 & System error detected: No bootloader available & & \\
\hline E 110B & 3 & \begin{tabular}{l}
Configuration error detected (additional info=Modbus register address) \\
Parameter _SigLatched Bit 30
\end{tabular} & Error detected during parameter check (for example, reference velocity value for operating mode Profile Position is greater than maximum permissible velocity of drive). & Value in additional error information shows the Modbus register address of the parameter where the initialization error was detected. \\
\hline E 110D & 1 & Basic configuration of drive required after factory setting & The "First Setup" (FSU) was not run at all or not completed. & Perform a First Setup. \\
\hline E 110E & 0 & Parameter changed that requires a restart of the drive & Only displayed by the commissioning software. A parameter modification requires the drive to be powered off and on. & Restart the drive to activate the parameter functionality. See the chapter Parameters for the parameter that requires a restart of the drive. \\
\hline E 110F & 0 & Function not available in this type of device & The specific type of device does not support this function or this parameter value. & Verify that you have the correct device type, in particular type of motor, type of encoder, holding brake. \\
\hline E 1110 & 0 & Incorrect file ID for upload or download & The specific type of device does not support this kind of file. & Verify that you have the correct device type or the correct configuration file. \\
\hline E 1111 & 0 & File transfer not correctly initialized & A previous file transfer has been aborted. & \\
\hline
\end{tabular}

\hline \begin{tabular}{l} 
Error \\
code
\end{tabular} & \begin{tabular}{l} 
Error \\
class
\end{tabular} & Description & Cause & Correctives \\
\hline E 1112 & 0 & Locking of configuration denied & \begin{tabular}{l} 
An external tool has tried to \\
lock the configuration of the \\
drive for upload or download. \\
This may not work because \\
another tool had already \\
locked the configuration of \\
the drive or the drive is in an \\
operating state that does not \\
allow locking.
\end{tabular} & \\
\hline E 1113 & 0 & & & \begin{tabular}{l} 
System not locked for \\
configuration transfer
\end{tabular} \\
\hline E 1114 & 4 & & \begin{tabular}{l} 
E 111 C
\end{tabular} & 1
\end{tabular}
\begin{tabular}{|c|c|c|c|c|}
\hline Error code & Error class & Description & Cause & Correctives \\
\hline E 111F & 1 & Recalculation not possible. & Invalid scaling factor. & Verify that you really want the selected scaling factor. Try a different scaling factor. Before triggering scaling, reset the parameters with user-defined units. \\
\hline E 1120 & 1 & Recalculation for scaling not possible & A parameter could not be recalculated. & The address of the parameter that caused this condition can be read via the parameter _PAR_ScalingError. \\
\hline E 1121 & 0 & Incorrect sequence of steps for scaling (fieldbus) & The recalculation has been started prior to the initialization. & The recalculation must be started after the initialization. \\
\hline E 1122 & 0 & Recalculation for scaling not possible & Recalculation for scaling is already running. & Wait for the running recalculation for scaling to finish. \\
\hline E 1123 & 0 & Parameter cannot be changed & Recalculation for scaling is running. & Wait for the running recalculation for scaling to finish. \\
\hline E 1124 & 1 & Timeout during recalculation for scaling & The time between the initialization of the recalculation and the start of the recalculation has been exceeded ( 30 seconds). & Recalculation must be started within 30 seconds after initialization. \\
\hline E 1125 & 1 & Scaling not possible & The scaling factors for position, velocity or acceleration/deceleration are beyond internal calculation limits. & Retry with different scaling factors. \\
\hline E 1126 & 0 & Configuration is blocked by another access channel & & Close other access channel (for example, other instance of commissioning software). \\

\section*{Chapter 10}

\section*{Parameters}

What Is in This Chapter?
This chapter contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Representation of the Parameters & 394 \\
\hline List of Parameters & 396 \\
\hline
\end{tabular}

\section*{Representation of the Parameters}

This chapter provides an overview of the parameters which can be used for operating the product.
Unsuitable parameter values or unsuitable data may trigger unintended movements, trigger signals, damage parts and disable monitoring functions. Some parameter values or data do not become active until after a restart.

\section*{A WARNING}

\section*{UNINTENDED EQUIPMENT OPERATION}
- Only start the system if there are no persons or obstructions in the zone of operation.
- Do not operate the drive system with undetermined parameter values or data.
- Never modify a parameter value unless you fully understand the parameter and all effects of the modification.
- Restart the drive and verify the saved operational data and/or parameter values after modifications.
- Carefully run tests for all operating states and potential error situations when commissioning, upgrading or otherwise modifying the operation of the drive.
- Verify the functions after replacing the product and also after making modifications to the parameter values and/or other operational data.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Overview
The way parameters are shown provides information required for unique identification, the default values and the properties of a parameter.

Structure of the parameter representation:
\begin{tabular}{|c|c|c|c|c|}
\hline Parameter name & Description & \begin{tabular}{l}
Unit \\
Minimum value \\
Factory setting \\
Maximum value
\end{tabular} & \begin{tabular}{l}
Data type \\
R/W \\
Persistent \\
Expert
\end{tabular} & Parameter address via fieldbus \\
\hline ABCDE & \begin{tabular}{l}
Short description \\
Selection values \\
1 / Abc1: Explanation 1 \\
2 / Abc2: Explanation 2 \\
Description and details
\end{tabular} & \[
\begin{aligned}
& \mathrm{A}_{\mathrm{pk}} \\
& 0.00 \\
& 3.00 \\
& 300.00
\end{aligned}
\] & UINT32 R/W per. & Fieldbus 1234 \\
\hline
\end{tabular}

Field "Parameter Name"
The parameter name uniquely identifies a parameter.

Field "Description"

\section*{Short description:}

The short description contains information on the parameter and a cross reference to the page that describes the use of the parameter.
Selection values:
In the case of parameters which offer a selection of settings, the value to be entered via the fieldbus and the designation of the value for entry via the commissioning software are specified.

1 = Value for input via fieldbus
Abc1 = Designation for entry via the commissioning software
Ab с \(\quad\) = Designation for entry via the HMI
Description and details:
Provides further information on the parameter.

Field "Unit"
The unit of the value.

Field "Minimum Value"
The minimum value which can be entered.

Field "Factory Settings"
Settings when the product is shipped.

Field "Maximum Value"
The maximum value which can be entered.

Field "Data Type"
If the minimum and the maximum values are not explicitly indicated, the valid range of values is determined by the data type.
\begin{tabular}{|l|l|l|}
\hline Data type & Minumum value & Maximum value \\
\hline INT8 & -128 & 127 \\
\hline UINT8 & 0 & 255 \\
\hline INT16 & -32768 & 32767 \\
\hline UINT16 & 0 & 65535 \\
\hline INT32 & -2147483648 & 2147483647 \\
\hline UINT32 & 0 & 4294967295 \\
\hline
\end{tabular}

Field "R/W"
Indicates read and/or write values
" \(R /\) /" values can only be read
"R/W" values can be read and written.

Field "Persistent"
"per." indicates whether the value of the parameter is persistent, i.e. whether it remains in the memory after the device is powered off.
When a value of a persistent parameter is modified via the commissioning software or the fieldbus, the user must explicitly store the modified value in the persistent memory.

Field "Parameter Address"
Each parameter has a unique parameter address. The parameter address is used to access the parameter via the fieldbus.

\section*{Decimal Numbers Entered via the Fieldbus}

Please note that parameter values are entered via the fieldbus without a decimal point. All decimal places must be entered.

Input examples:
\begin{tabular}{|l|l|l|}
\hline Value & Commissioning software & Fieldbus \\
\hline 20 & 20 & 20 \\
\hline 5.0 & 5.0 & 50 \\
\hline 23.57 & 23.57 & 2357 \\
\hline 1.000 & 1.000 & 1000 \\
\hline
\end{tabular}

\hline ENC1_adjustment & \begin{tabular}{l}
Adjustment of absolute position of encoder 1 \\
The value range depends on the encoder type. \\
Singleturn encoder:
\[
0 \ldots x-1
\] \\
Multiturn encoder:
\[
0 \ldots(4096 * x)-1
\] \\
Singleturn encoder (shifted with parameter ShiftEncWorkRang):
\[
-(x / 2) \ldots(x / 2)-1
\] \\
Multiturn encoder (shifted with parameter ShiftEncWorkRang):
\[
-\left(2048^{*} x\right) \ldots\left(2048^{*} x\right)-1
\] \\
Definition of 'x': Maximum position for one encoder turn in user-defined units. This value is 16384 with the default scaling. \\
If processing is to be performed with inversion of the direction of movement, this must be set before the encoder position is adjusted. \\
After the write access, a wait time of at least 1 second is required before the drive can be powered off. \\

\hline SimAbsolutePos & \begin{tabular}{l}
Simulation of absolute position at power cycling \\
0 / Simulation Off: Do not use the last mechanical position after power cycling \\
1/Simulation On: Use last mechanical position after power cycling This parameter specifies the way position values are handled over a power cycle and allows for the simulation of an absolute position encoder using singleturn encoders. \\
If this function is activated, the drive saves the pertinent position data prior to a power removal so that the drive can restore the mechanical position the next time it is powered on. \\
In the case of singleturn encoders, the position can be restored if the motor shaft has not been moved by more than 0.25 revolutions while the drive was powered off. \\
In the case of multiturn encoders, the permissible shaft movement while the drive is off can be much greater, depending on the type of multiturn encoder. \\
For this function to work, the drive may only be powered off while the motor is at a standstill and the motor shaft must not be moved outside of the permissible range (for example, use a holding brake). \\
Changed settings become active immediately.

\section*{Chapter 11}

\section*{Accessories and Spare Parts}

What Is in This Chapter?
This chapter contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Commissioning Tools & 476 \\
\hline Memory Cards & 477 \\
\hline Mains Supply for Slot 1 or Slot 2 & 478 \\
\hline Braking Resistors for Slot 1 or Slot 2 & 479 \\
\hline External Braking Resistors & 480 \\
\hline I/O Module with Industrial Connector for Positive Logic & 481 \\
\hline I/O Module with Industrial Connector for Negative Logic & 482 \\
\hline I/O Module with Spring Terminals & 483 \\
\hline Cables for Safety Function STO & 484 \\
\hline Industrial Plug Connectors & 485 \\
\hline
\end{tabular}

\section*{Commissioning Tools}
\begin{tabular}{|l|l|}
\hline Description & Reference \\
\hline PC connection kit, serial connection between drive and PC, USB-A to RJ45 & TCSMCNAM3M002P \\
\hline Multi-Loader, device for copying the parameter settings to a PC or to another drive & VW3A8121 \\
\hline Modbus cable, \(1 \mathrm{~m}(3.28 \mathrm{ft}), 2 \times\) RJ45 & VW3A8306R10 \\
\hline
\end{tabular}

\section*{Memory Cards}
\begin{tabular}{|l|l|}
\hline Description & Reference \\
\hline Memory card for copying parameter settings & VW3M8705 \\
\hline 25 memory cards for copying parameter settings & VW3M8704 \\
\hline
\end{tabular}

Mains Supply for Slot 1 or Slot 2
\begin{tabular}{|l|l|}
\hline Description & Reference \\
\hline LXM32I connection module mains supply, single-phase & VW3M9001 \\
\hline LXM32I connection module mains supply, three-phase & VW3M9002 \\
\hline
\end{tabular}

\section*{Braking Resistors for Slot 1 or Slot 2}
\begin{tabular}{|l|l|}
\hline Description & Reference \\
\hline LXM32I module standard braking resistor, single-phase \(35 \Omega, 20 \mathrm{~W}\) & VW3M9021 \\
\hline LXM32I module standard braking resistor, three-phase, \(70 \Omega, 20 \mathrm{~W}\) & VW3M9022 \\
\hline LXM32I connection module external braking resistor & VW3M9010 \\
\hline
\end{tabular}

\section*{External Braking Resistors}
\begin{tabular}{|c|c|}
\hline Description & Reference \\
\hline Braking resistor IP65; \(27 \Omega\); maximum continuous power \(100 \mathrm{~W} ; 0.75 \mathrm{~m}(2.46 \mathrm{ft})\) connection cable, \(2.1 \mathrm{~mm}^{2}\) (AWG 14), UL & VW3A7602R07 \\
\hline Braking resistor IP65; \(27 \Omega\); maximum continuous power \(100 \mathrm{~W} ; 2 \mathrm{~m}(6.56 \mathrm{ft})\) connection cable, \(2.1 \mathrm{~mm}^{2}\) (AWG 14), UL & VW3A7602R20 \\
\hline Braking resistor IP65; \(27 \Omega\); maximum continuous power 100 W ; \(3 \mathrm{~m}(9.84 \mathrm{ft})\) connection cable, \(2.1 \mathrm{~mm}^{2}\) (AWG 14), UL & VW3A7602R30 \\
\hline Braking resistor IP65; \(27 \Omega\); maximum continuous power \(200 \mathrm{~W} ; 0.75 \mathrm{~m}(2.46 \mathrm{ft})\) connection cable, \(2.1 \mathrm{~mm}^{2}\) (AWG 14), UL & VW3A7603R07 \\
\hline Braking resistor IP65; 27 ת; maximum continuous power \(200 \mathrm{~W} ; 2 \mathrm{~m}(6.56 \mathrm{ft})\) connection cable, \(2.1 \mathrm{~mm}^{2}\) (AWG 14), UL & VW3A7603R20 \\

\end{tabular} & VW3M94CR15 \\
\hline \begin{tabular}{l} 
Pre-assembled cable for the safety function STO, \(20 \mathrm{~m} \mathrm{( } 65.6 \mathrm{ft}), 3 \times 0.34 \mathrm{~mm}^{2}\), industrial \\
connector M8, female connector M8, shielded
\end{tabular} & VW3M94CR20 \\
\hline
\end{tabular}

\section*{Industrial Plug Connectors}
\begin{tabular}{|l|l|}
\hline Description & Reference \\
\hline Connector kit for Ethernet, \(2 \times\) male industrial connector M12, \(1 \times\) sealing cap M12 & VW3L5E000 \\
\hline Connector kit for I/O, \(2 \times\) industrial connector M8 & VW3L50200 \\
\hline Connector kit for I/O, \(3 \times\) industrial connector M8 & VW3L50300 \\
\hline Y-cable, DI/DO splitter cable, industrial connector M8, \(1 \times 6\)-pin to \(2 \times 3\)-pin, 2 pieces & VW3M9601 \\
\hline Connector for STO output, \(1 \times\) industrial connector M8 & VW3L50010 \\
\hline Sealing caps for I/O module with industrial connectors, \(5 \times\) M8, \(1 \times\) M12 & VW3M9530 \\
\hline
\end{tabular}

\section*{Chapter 12}

Service, Maintenance, and Disposal

What Is in This Chapter?
This chapter contains the following topics:
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Topic } & Page \\
\hline Service Addresses & 488 \\
\hline Maintenance & 489 \\
\hline Replacing the Product & 491 \\
\hline Shipping, Storage, Disposal & 492 \\
\hline
\end{tabular}

\section*{Service Addresses}

Schneider Electric Automation GmbH
Schneiderplatz 1
97828 Marktheidenfeld, Germany
Phone: +49 (0) 9391 / 606-0
Fax: +49 (0) 9391 / 606-4000
Email: info-marktheidenfeld@schneider-electric.com
Internet: http://www.schneider-electric.com

Machine Solutions Service
Schneiderplatz 1
97828 Marktheidenfeld, Germany
Phone: +49 (0) 9391 / 606-3265
Fax: +49 (0) 9391 / 606-3340
Email: automation.support.de@schneider-electric.com Internet: http://www.schneider-electric.com

Additional Contact Addresses
See the homepage for additional contact addresses:
http://www.schneider-electric.com

\section*{Maintenance}

\section*{Maintenance Plan}

Inspect the product for pollution or damage at regular intervals.
Repairs may only be made by the manufacturer. No warranty or liability is accepted for repairs made by unauthorized persons

Prior to any type of work on the drive system, consult the chapters on Installation and Commissioning for information on the precautions and processes to be observed.

Include the following points in the maintenance plan of your machine.

\section*{Connections and Fastening}
- Inspect all connection cables and connectors regularly for damage. Replace damaged cables immediately.
- Verify that all output elements are firmly seated.
- Tighten all mechanical and electrical threaded connections to the specified torque.

Lubricating the Shaft Sealing Ring
In the case of motors with shaft sealing ring, lubricant must be applied to the space between the sealing lip of the shaft sealing ring and the shaft with a suitable non-metallic tool. If the shaft sealing rings are allowed to run dry, the service life of the shaft sealing rings will be significantly reduced.

\section*{Cleaning}

If the permissible ambient conditions are not respected, external substances from the environment may penetrate the product and cause unintended movement or equipment damage.

\section*{A WARNING}

\section*{UNINTENDED MOVEMENT}
- Verify that the allowable ambient conditions specified in the present document and in the documentation of any supporting hardware or accessories are respected.
- Do not allow seals to run dry.
- Keep liquids from getting to the shaft bushing (for example, in mounting position IM V3).
- Do not expose the shaft sealing rings and cable entries of the motor to the direct spray of a pressure washer.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

Clean dust and dirt off the product at regular intervals. Insufficient heat dissipation to the ambient air may excessively increase the temperature.
Motors are not suitable for cleaning with a pressure washer. The high pressure may force water into the motor.

When using solvents or cleaning agents, verify that the cables, cable entry seals, O-rings and motor paint are not damaged.

\section*{Inspecting/Breaking In the Holding Brake}

The holding brake is broken-in at the factory. If the holding brake is not used for an extended period of time, parts of the holding brake may corrode. Corrosion reduces the holding torque.

If the holding brake does not have the holding torque indicated in the technical data, it must be broken in again.
- If the motor is mounted, dismount the motor.
- Measure the holding torque of the holding brake using a torque wrench.
- If the holding torque of the holding brake considerably differs from the specified values, manually rotate the motor shaft by 25 rotations in both directions. See chapter Holding Brake (Option) (see page 37) for the values.
- Repeat the process up to 3 times, until you can restore the original holding torque. Contact your Schneider Electric representative if the original holding torque is not restored.

\section*{Replacing the Rolling Bearing}

When the rolling bearing is replaced, the motor is partially demagnetized and loses power.
\begin{tabular}{|l|l|}
\hline \multicolumn{1}{|c|}{ NOT/CE } \\
\hline INOPERABLE EQUIPMENT \\
Do not replace the rolling bearing. \\
Failure to follow these instructions can result in equipment damage. \\
\hline
\end{tabular}

For all service matters, contact your Schneider Electric representative.

\section*{Lifetime Safety Function STO}

The STO safety function is designed for a lifetime of 20 years. After this period, the data of the safety function are no longer valid. The expiry date is determined by adding 20 years to the DOM shown on the nameplate of the product.
- This date must be included in the maintenance plan of the system.

Do not use the safety function after this date.
Example:
The DOM on the nameplate of the product is shown in the format DD.MM.YY, for example 31.12.16. (31 December 2016). This means: Do not use the safety function after December 31, 2036.

\section*{Replacing the Product}

Opening the side wall exposes hazardous voltages and damages the insulation.

\section*{4 ! DANGER}

\section*{ELECTRIC SHOCK}

Do not open the side wall.
Failure to follow these instructions will result in death or serious injury.

Unsuitable parameter values or unsuitable data may trigger unintended movements, trigger signals, damage parts and disable monitoring functions. Some parameter values or data do not become active until after a restart.

\section*{A WARNING}

\section*{UNINTENDED EQUIPMENT OPERATION}
- Only start the system if there are no persons or obstructions in the zone of operation.
- Do not operate the drive system with undetermined parameter values or data.
- Never modify a parameter value unless you fully understand the parameter and all effects of the modification.
- Restart the drive and verify the saved operational data and/or parameter values after modifications.
- Carefully run tests for all operating states and potential error situations when commissioning, upgrading or otherwise modifying the operation of the drive.
- Verify the functions after replacing the product and also after making modifications to the parameter values and/or other operational data.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Only replace BMi and Lexium 32i together. Do not replace one of the two individually.
Follow the procedure below for replacing devices.
- Save all parameter settings. To do so, use a memory card or save the data to a PC using the commissioning software, see chapter Parameter Management (see page 183).
- Power off all supply voltages. Verify that no voltages are present (safety instructions).
- Label all connections and remove all connection cables (unlock connector locks).
- Uninstall the product.
- Note the identification number and the serial number shown on the product nameplate for later identification.
- Install the new product as per chapter Installation (see page 95).
- If the product to be installed has previously been used in a different system or application, you must restore the factory settings before commissioning the product.
- Commission the product as per chapter Commissioning (see page 135).

Shipping, Storage, Disposal

Shipping
The product must be protected against shocks during transportation. If possible, use the original packaging for shipping.

Storage
The product may only be stored in spaces where the specified permissible ambient conditions are met. Protect the product from dust and dirt.

Disposal
The product consists of various materials that can be recycled. Dispose of the product in accordance with local regulations.
Visit http://www.schneider-electric.com/green-premium for information and documents on environmental protection as per ISO 14025 such as:
- EoLi (Product End-of-Life Instructions)
- PEP (Product Environmental Profile)

\section*{A}

Actual value
In control engineering, the actual value is the value of the controlled variable at a given instant (for example, actual velocity, actual torque, actual position). The actual value is an input value (measured value) used by the control loops to reach the reference value.

D
DC bus
Circuit that supplies the power stage with energy (direct voltage).
Degree of protection
The degree of protection is a standardized specification for electrical equipment that describes the protection against the ingress of foreign objects and water (for example: IP 20).

Direction of movement
In the case of a rotary motors, direction of movement is defined in accordance with IEC 61800-7-204: Positive direction is when the motor shaft rotates clockwise as you look at the end of the protruding motor shaft.

DOM
Date of manufacturing: The nameplate of the product shows the date of manufacture in the format DD.MM.YY or in the format DD.MM.YYYY. For example:
31.12.11 corresponds to December 31, 2011
31.12.2011 corresponds to December 31, 2011

\section*{DriveCom}

Specification of the DSP402 state machine was created in accordance with the DriveCom specification.

\section*{E}

EDS
(Electronic Data Sheet); contains the specific properties of a product.
EMC
Electromagnetic compatibility
Encoder
Sensor that converts a measured distance or angle into an electrical signal. This signal is evaluated by the drive to determine the actual position of a shaft (rotor) or a driving unit.
Error
Discrepancy between a detected (computed, measured or signaled) value or condition and the specified or theoretically correct value or condition.

\section*{Error class}

Classification of errors into groups. The different error classes allow for specific responses to errors, for example by severity.

\section*{F}

\section*{Factory settings}

Settings when the product is shipped.
Fault
Fault is an operating state. If the monitoring functions detect an error, a transition to this operating state is triggered, depending on the error class. A "Fault Reset" or a power cycle are required to exit this operating state. Prior to this, the cause of the detected error must be removed. Further information can be found in the pertinent standards such as IEC 61800-7, ODVA Common Industrial Protocol (CIP).

\section*{Fault Reset}

Holding brake

Inc

Index pulse

Internal units

IT mains

\section*{Limit switch}

\section*{Mapping}

\section*{Parameter}

PELV

Persistent

Power stage

\section*{Quick Stop}

RCD

The function can be used for fast deceleration of a movement as a response to a detected error or via a command.

R
Function used to exit the operating state Fault. Before the function is used, the cause of the detected error must be removed.

\section*{H}

The holding brake in the motor has the task of holding the motor position when the power stage is disabled. The holding brake is not a safety function and not a service brake.

I

Increments

Signal of an encoder to reference the rotor position in the motor. The encoder returns one index pulse per revolution.

Resolution of the power stage at which the motor can be positioned. Internal units are specified in increments.

Mains in which all active components are isolated from ground or are grounded by a high impedance. IT: isolé terre (French), isolated ground.

Opposite: Grounded mains, see TT/TN mains

L

Switches that signal overtravel of the permissible range of travel.
M

Assignment of object dictionary entries to PDOs

P

Device data and values that can be read and set (to a certain extent) by the user.

Protective Extra Low Voltage, low voltage with isolation. For more information: IEC 60364-4-41

Indicates whether the value of the parameter remains in the memory after the device is switched off.

The power stage controls the motor. The power stage generates current for controlling the motor on the basis of the motion signals from the controller.

\section*{Q}

RCD residual current device.
rms
"Root Mean Square" value of a voltage \(\left(\mathrm{V}_{\mathrm{rms}}\right)\) or a current \(\left(\mathrm{A}_{\mathrm{rms}}\right)\)
RS485
Fieldbus interface as per EIA-485 which enables serial data transmission with multiple devices.

\section*{S}

Scaling factor
This factor is the ratio between an internal unit and a user-defined unit.

T
TT mains, TN mains
Grounded mains, differ in terms of the ground connection (PE conductor connection). Opposite: Ungrounded mains, see IT mains.

\section*{U}

User-defined unit
Unit whose reference to motor movement can be determined by the user via parameters.

[^0]:    ${ }^{1)}$ Multipoint grounding is permissible if connections are made to an equipotential ground plane dimensioned to help avoid cable shield damage in the event of power system short-circuit currents.

[^1]:    ## A WARNING

    UNINTENDED EQUIPMENT OPERATION

    - Perform a hazard and risk analysis to determine the appropriate safety integrity level, and any other safety requirements, for your specific application based on all the applicable standards.
    - Ensure that the hazard and risk analysis is conducted and respected according to EN/ISO 12100 during the design of your machine.

    Failure to follow these instructions can result in death, serious injury, or equipment damage.

[^2]:    $\triangle$ WARNING
    INCORRECT MAINS VOLTAGE
    Verify that the product is approved for the mains voltage before applying power and configuring the product.

    Failure to follow these instructions can result in death, serious injury, or equipment damage.
