

- 1/12 Degree of dirtiness**
0% clean filter
100% Filter completely clogged by dirt
- 2/12 Air temperature**
Measure the temperature that passes through the filter.
Scale from -40°C to +70°C / -40°F to 158°F
- 3/12 Filter renewal**
Days since the last filter renewal
- 4/12 Filter changes**
Total number of times the filter has been changed.
- 5/12 Active alarm**
Alarms in the filter sensor.
AL1: Temp out AL2: Filter alarm
- 6/12 Output configuration LEDs**
Set when the warning LEDs are activated:
Filter status: Green -> 0% to 60% filter dirtiness
Yellow -> 60% to 80% filter dirtiness
Red -> 80% to 100% filter dirtiness
Alarms: Flashing red -> Alarm in the system
Demo: Activates the color % of the LEDs randomly to display the entire available color range.
Brightness: Brightness intensity of the LEDs
- 7/12 Filter change**
Remaining life until we have to change the filter. Indicate the point to change the filter. It will activate an alarm when it reaches the target.
- 8/12 High Temperature Alarm**
Reports an alarm if the temperature sensor reads higher than the defined setting, factory setting 60°C. The current temperature reading is displayed on the screen
- 9/12 Low Temperature Alarm**
Reports an alarm if the temperature sensor reads lower than the defined setting, factory -5°C. The current temperature reading is displayed on the screen
- 10/12 Maximum Registered Temperature**
The highest temperature reading recorded by that sensor.
- 11/12 Minimum Registered Temperature**
The lowest temperature reading recorded by that sensor.
- 12/12 PING function**
Activate a visual indication by inverting colors of the screen (white background and black letters) to be able to identify it. On the screen the countdown of the time defined for PING. Option to restart the device with the factory parameters.

Controls and monitors the status of ventilation systems in cabinets to prevent breakdowns or failures. Equipped with ports to connect up to 4 devices (sensors for filters or fans, hubs or even another filterstat controller). Through these ports the controller receives the data and feeds the connected devices.

It also has a relay output (5A) that can link to the state of the alarms and an analog output (0-10) that is linked to the dirtiness of the filter (it will always read the filter with the major dirtiness detected).

Connection

V+ V- = 0-10V analog output
C NO = Relay SPST 5A
L N = Power according to model
C1, C2, C3, C4 = Connection devices(sensor, hub, filterstat ...)

LEDs

Equipped with 8 LEDs, 2 per channel (1 green & 1 orange)
- Green flashing, receiving data
- Orange flashing, sending data
- Fixed orange, problems with the channel

Characteristics

Power
NSYCCOFST30V: **19 ... 30Vdc**
NSYCCOFST90250V: **90 ... 250Vac 50/60 Hz**
Relay breaking power : **5A SPST**
(Potential-free relay contact)
Analog output: **0 ... 10V**
Measurements: **80x80x41 mm**
Operating temperature: **-40 ... +70°C**
Storage Temperature: **-45 ... +75°C**
Moisture R. Operation: **20 ... 85%**
Memory of settings without power

Keyboard

- ↑ - Advance data screen
Increase value
- ↓ - Go back data screen
Decreases value
- ↕ - Enter the menu to configure the Filterstat
- OK - Enter to modify adjustment
Confirm value, OK
- ESC - Inside menu, exit without saving data
In normal operation, it shows the list of connected devices

Filterstat menu

From the control screen you can configure the devices one by one, read the information registered by each of them and reset them. With the option **HIDE** you can filter the data you want to see on the screen and leave only the necessary information, defining from the menu of each screen of each device whether or not it is shown in **NORMAL** operation. In the **CONFIG** operation, you can view them all even if they have the **HIDE ON** option, and consult or configure them. In the menu you can configure the data screens.

Press at once, and menu appears:

- Allows to define the temperature units.
- The way to teach the data screens, pass automatically every 4 seconds or manually.
- Show all screens or only those enabled.
- Activated, you need to enter the code to access the menu

Menu
Temperature: **CELSIUS** (Centigrade Degrees) **FAHREN.** (Fahrenheit degrees)
Screen display: **AUTO VIS** (passes screen every 4 seconds)
MAN VIS (passes screen by pressing arrows)
Data screens: **CUST SCR** (shows only those enabled)
ALL SCR (shows all)
Password: **PASSWRD** (from factory 0000, deactivated)

Operative Data Screens

When it reaches the last data screen of that device, it goes to the first of the next device.
If the screen display is in AUTO and we press a key, the display changes to fixed for 10 minutes, then returns to AUTO mode
If you want to see a specific device you do not need to go through all the screens until you reach it, pressing ESC shows you a screen with a list of all the devices, and with the arrows you select it. (the alarm screen is listed as one more device)

Acces with the password activated

Alarm screen

- 1/1 Active alarms in the network**
This screen is listed as one more device, at the end of the devices in the network. If an alarm is activated, this screen is fixed and if the on-screen option 6/12 is activated (FILTER + AL or ALARM) a flashing red light will be shown on the filter sensor.

- Filter alarm** (dirty filter alarm) - It is activated when it detects that the filth of the filter exceeds the value defined in the **Filter changes** screen, adjustable by the user.
- Temp out** (Overheating alarm) - Activated when the temperature reading exceeds the value defined in the **High Temperature Alarm** screen, adjustable by the user.
- RPM slow** (Slow speed fan alarm) - Activated when the fan speed is below the level defined in the **Configuration alarms and status of the Fan**, adjustable by the user.
- Fan blocked** (Blocked blades alarm)- It is activated when it detects current consumption in the fan, but it does not detect that the fan turns (there are no readings of r.p.m. but but if energy consumption).

- Lack current** - It is activated when the fan sensor detects that the fan turns but does not consume current (there are r.p.m readings but it does not receive energy consumption readings,0mA).
- Lifetime over** - activated when the device it protects is older than its life expectancy and can be replaced by a new one. Violet LED flashing on the sensor.
- AT deviation** (Deviation of Δt) - It is marked when the deviation Δt is greater than the value defined in the **Configuration ΔT Delta temperature and alarm between two temperature readings**, adjustable by the user
- Broken ref** (broken device link) - Occurs when a device in the network is disconnected and is part of a calculation, for example: we disconnect (from the bus cable) a device that is using Filterstat in the temperature readings for temperature delta.

Screen

Quick access menu to devices

From any screen you can access the menu by pressing , it will list all the devices in the network and by means of the arrows choose which one you want to go to directly.

Screens available for the Filterstat
